# Brief summary of Session 77

From Enectali Figueroa-Feliciano

## Dark Matter and Neutrino Particle Detection

← Wave Dark Matter

This slide is a work in progress...  
intended to promote discussion as to  
how to organize. Please let me know how  
what I'm missing!

# Brief summary of Session 77

## Wavelike Dark Matter Detection

From Derek Jackson Kimball  
A wavelike companion to Tali's  
Slide, also intended to promote  
discussion about organization

# Brief summary of Session 77

There is a nice portfolio of projects at different stages.

- Sensor and Readout R&D to improve the performance especially the noise characteristics (sometime pushing the standard quantum limit) of the detector systems themselves.
- Scaling R&D, how do deploy quantum sensors in mid-scale experiments (here you find multiplexing and the needs of neutrino experiments for CEvNS and  $0\nu\beta\beta$ ).

# Complementarity questions for 77.

- Quantum Information not just for sensing, we should also think about complementarity of readout, infrastructure and using QI to study the physics of the sensors themselves.
- **Gravitational wave detectors** and experiments using **atomic techniques** provide new windows and complementary technology challenges to the current suite of experiments.

# Practical work needed for these ideas in #77

- A theme is emerging that we need a high level summary of the techniques and the physics they can probe. Some of this was done for the [BRN for New Initiatives](#).
- We need to decide on the best way to group techniques. We tend to default to the candidate mass.
- We need a theory effort to guide preferred parameter space and perhaps help with design consideration that would allow us to probe different physics (for instance the number and size of a multi-detector system).
- We need to summarize the common infrastructure needs of this work (cryogenic systems, shielding, magnets etc.)
- Others we haven't considered?
