

The collage consists of four vertically stacked images: 1) A large radio telescope dish against a star-filled night sky. 2) A satellite in space with solar panels, emitting a bright light. 3) A ground-based detector array with many small, yellow cylindrical structures in a field. 4) A snow-covered mountain peak under a clear blue sky.

# Searching for Dark Matter with Cosmic Gamma rays

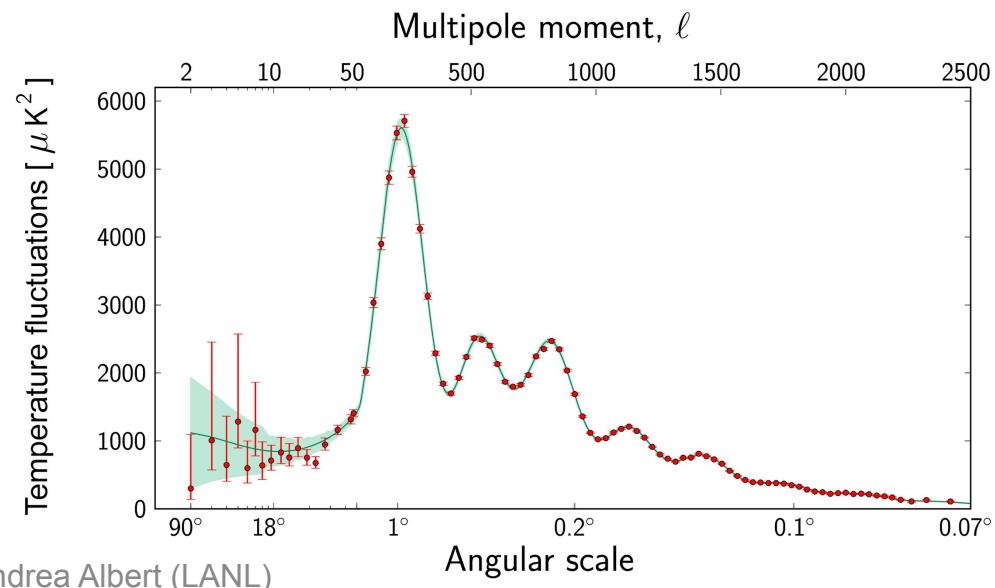

**Andrea Albert**  
**Los Alamos National Laboratory**  
**Friday August 14th, 2020**  
**Snowmass CF1 Townhall**

# Dark Matter Primer

- Galaxies form in Dark Matter *halos* of various sizes, which make up most of their *mass*
  - Coma Cluster + Virial, F. Zwicky (1937)
  - Rotation Curves, V. Rubin et al 1980

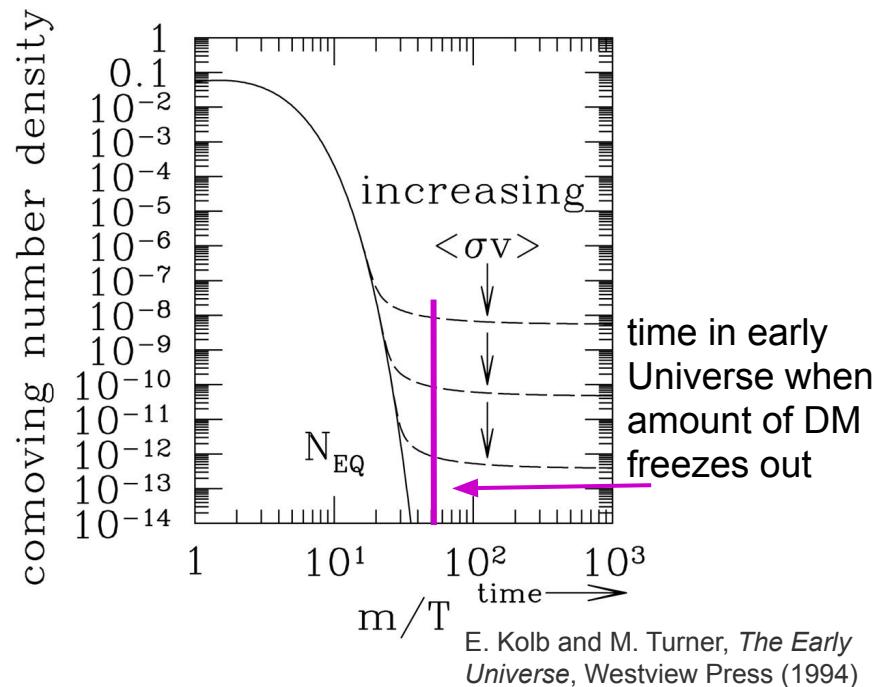

- Dark Matter is virtually *collisionless*
  - The Bullet Cluster, D. Clowe et al (2006)

Andrea Albert (LANL)

# Thermal WIMPs

- **Weakly Interacting Massive Particle (WIMP)**
  - WIMPs may be thermal relics
  - e.g. neutralino (SUSY, electrically neutral, stable)
- Assuming a weak scale  $\sigma_{\text{ann}}$  at freeze yields observed relic abundance
  - $\langle \sigma v \rangle_{\text{ann}} \sim 3 \times 10^{-26} \text{ cm}^3/\text{s}$
- Thermal WIMPs predicting the correct relic abundance makes them a very promising model to test!
- Thermal WIMP mass limit  $\sim 100 \text{ TeV}$  (unitarity bound)

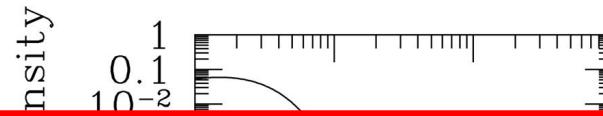

E. Kolb and M. Turner, *The Early Universe*, Westview Press (1994)

# Thermal WIMPs

- **Weakly Interacting Massive Particle (WIMP)**

- **W**I focus on thermal WIMPs, but there are several other
  - **e.g.** dark matter candidates you can probe with cosmic
  - **ne** gamma rays

- **Assume** yields

# Gamma rays from DM

**Dark Matter annihilation or decay  
could produce gamma rays observable  
at Earth**

**Gamma rays travel straight so we look  
for gamma-ray sources overlapping  
with known dark-matter halos**

# WIMP Dark Matter Targets

# Current Gamma-ray Observatories

VERITAS Array

Tucson, Arizona  
31° North Latitude, ~5° f.o.v.  
~85 GeV -- ~50 TeV

MAGIC  
La Palma, Canary Islands  
29° North Latitude, ~5° f.o.v.  
~30 GeV -- ~30 TeV

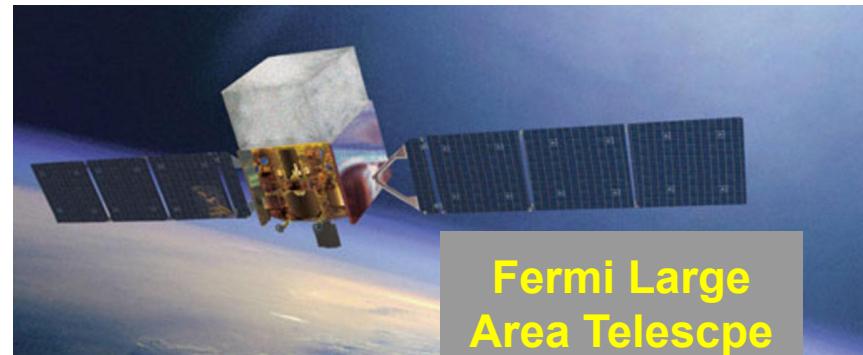

H.E.S.S.  
Khomas Highland of Namibia  
23° South Latitude, ~5° f.o.v.  
~30 GeV -- ~100 TeV

HAWC Observatory

Parque Nacional Pico de Orizaba, México  
19° North Latitude, ~2 sr f.o.v.  
~50 GeV -- ~100 TeV, 100% Duty Cycle

Fermi Large  
Area Telescope

Low earth orbit (565 km)  
28.5° orbital inclination, ~2 sr f.o.v.  
20 MeV -- > 300 GeV, 100% Duty Cycle  
(AGILE has similar technology, but has limited energy resolution)

# Partially Built and Future Gamma-ray Observatories

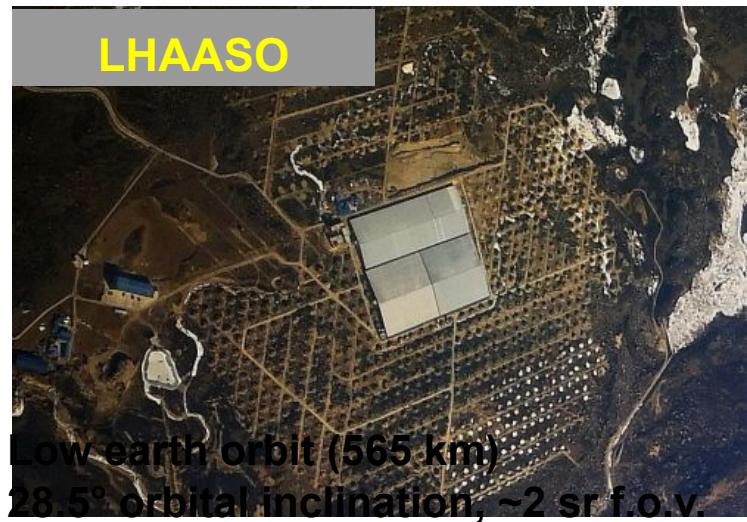

Cherenkov Telescope Array (CTA)

Northern Array: La Palma  $29^{\circ}$  N Latitude | Southern Array: Paranal Chili  $24.6^{\circ}$  South Latitude  
 $\sim 10^{\circ}$  f.o.v. |  $\sim 50$  GeV --  $\sim 200$  TeV

## Southern Wide Field of View Gamma Ray Observatory (SWGO)

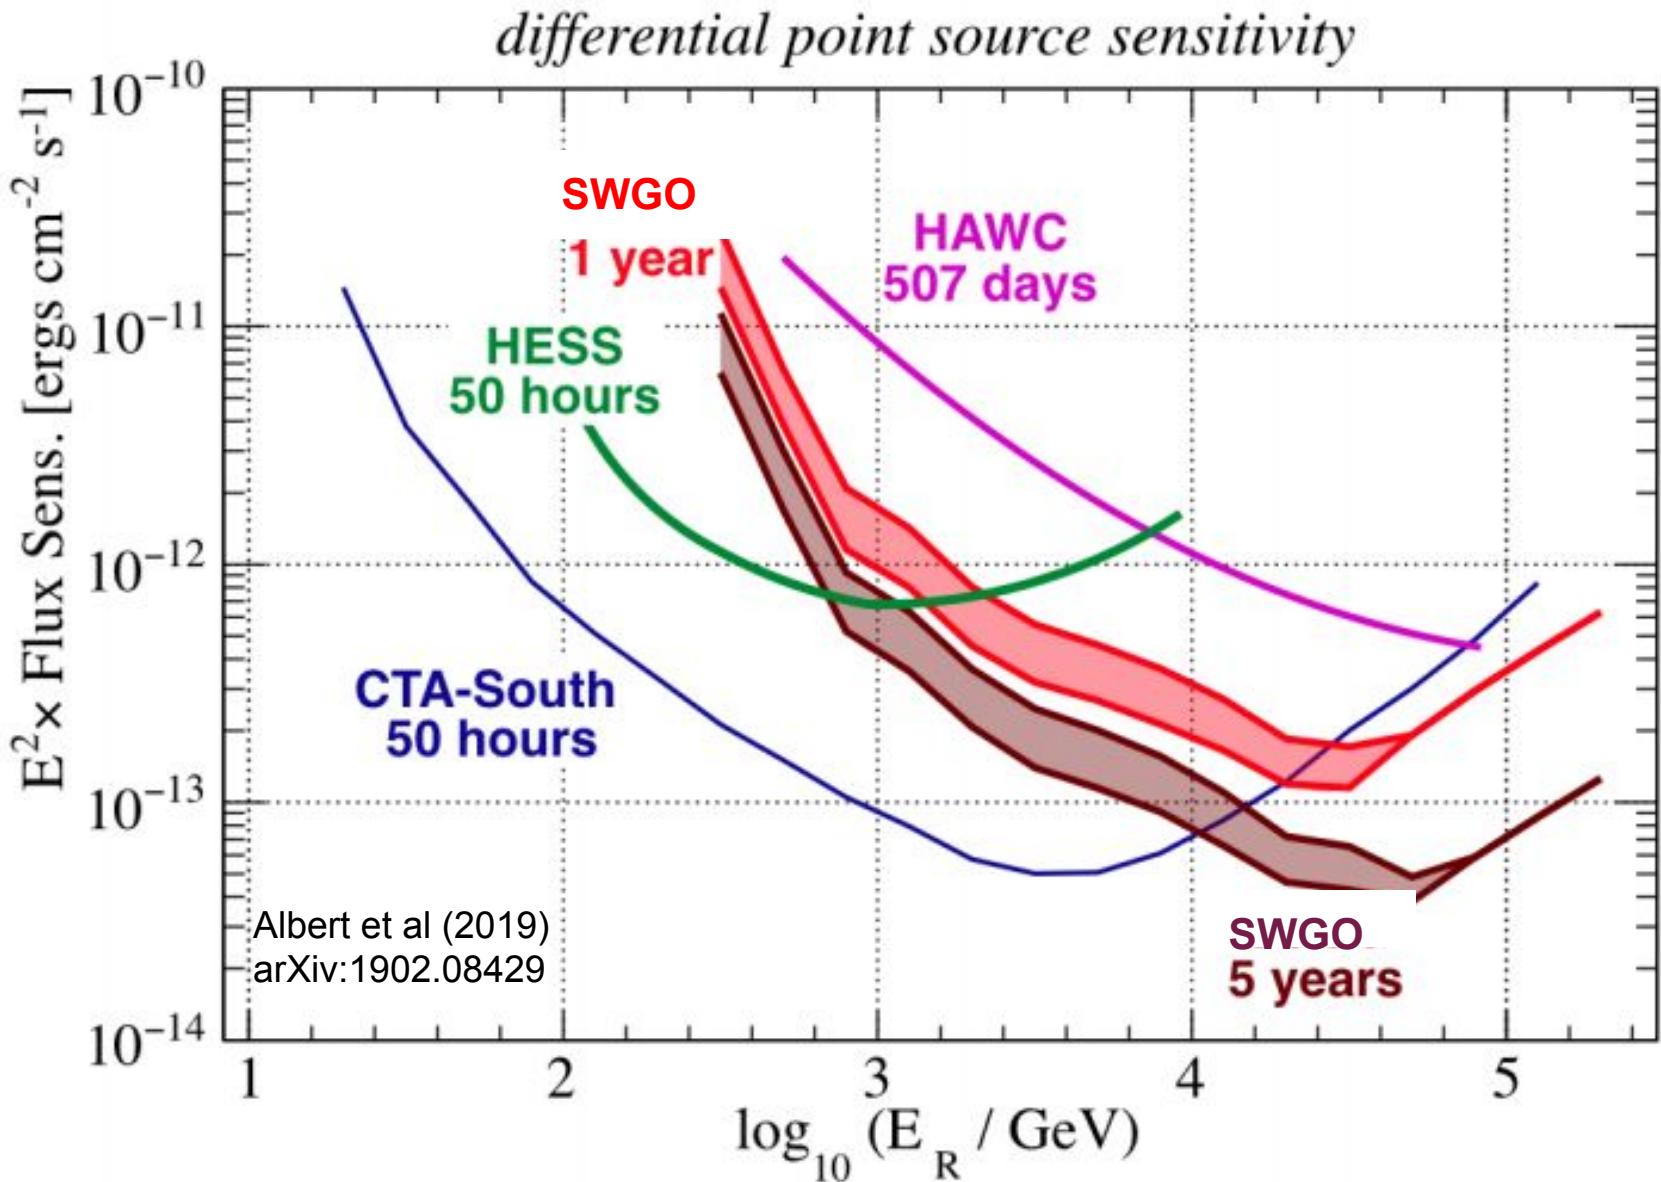

Location TBD (Southern Hemisphere)  
 $\sim 20^{\circ}$  South Latitude,  $\sim 2$  sr f.o.v.  
 $\sim 500$  GeV --  $\sim 500$  TeV, 100% Duty Cycle

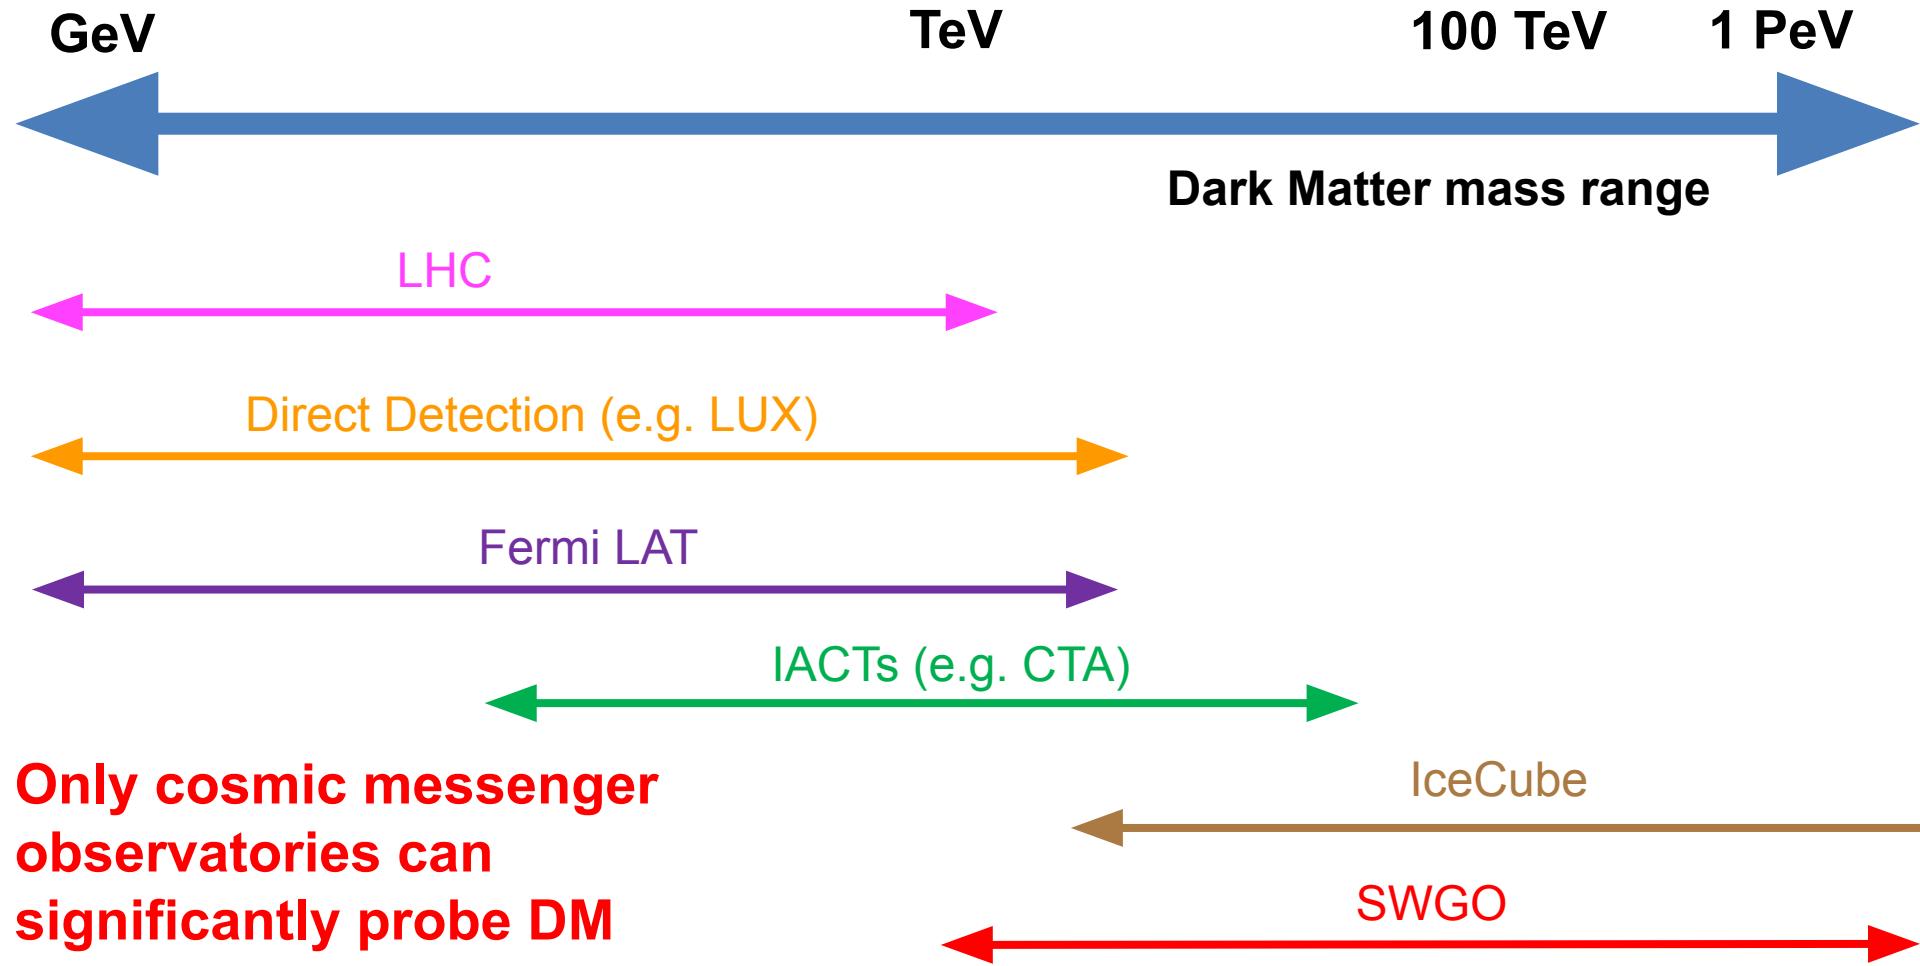

Daocheng, China  
 $\sim 28^{\circ}$  Northern Latitude,  $\sim 2$  sr f.o.v.  
30 GeV -- 1 PeV, 100% Duty Cycle

# Gamma-ray Observatory Sensitivities

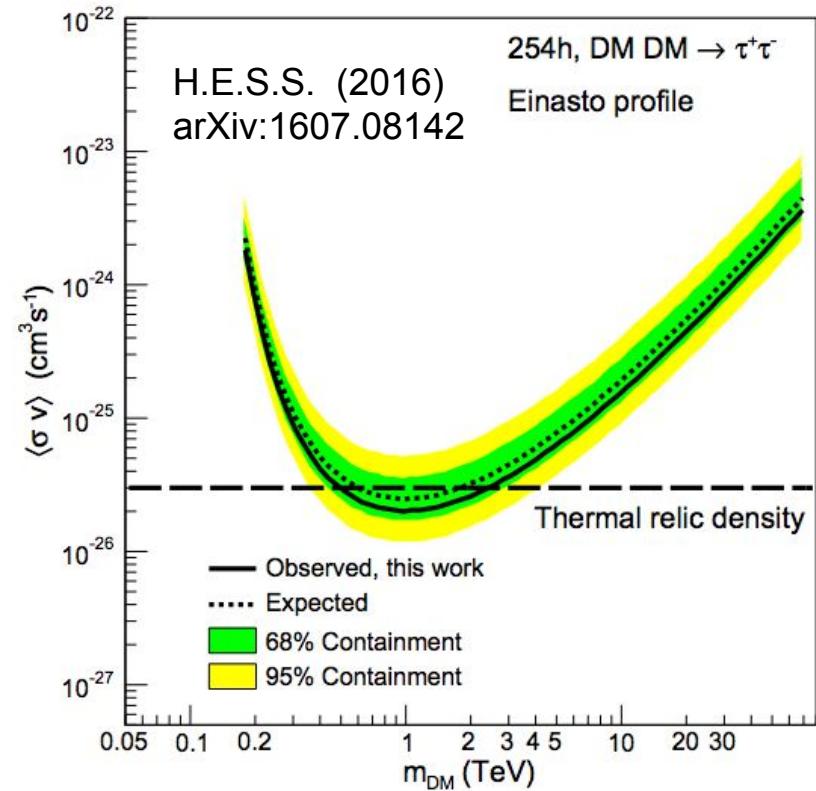

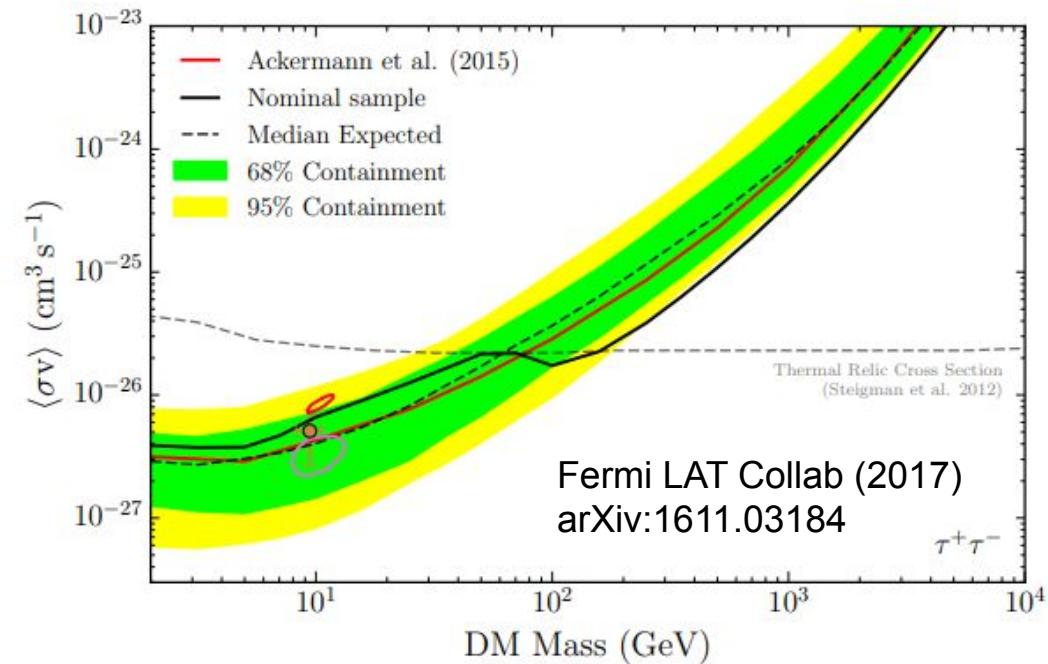

# Complementarity of Dark Matter Masses

**Only cosmic messenger observatories can significantly probe DM with mass  $>20$  TeV**

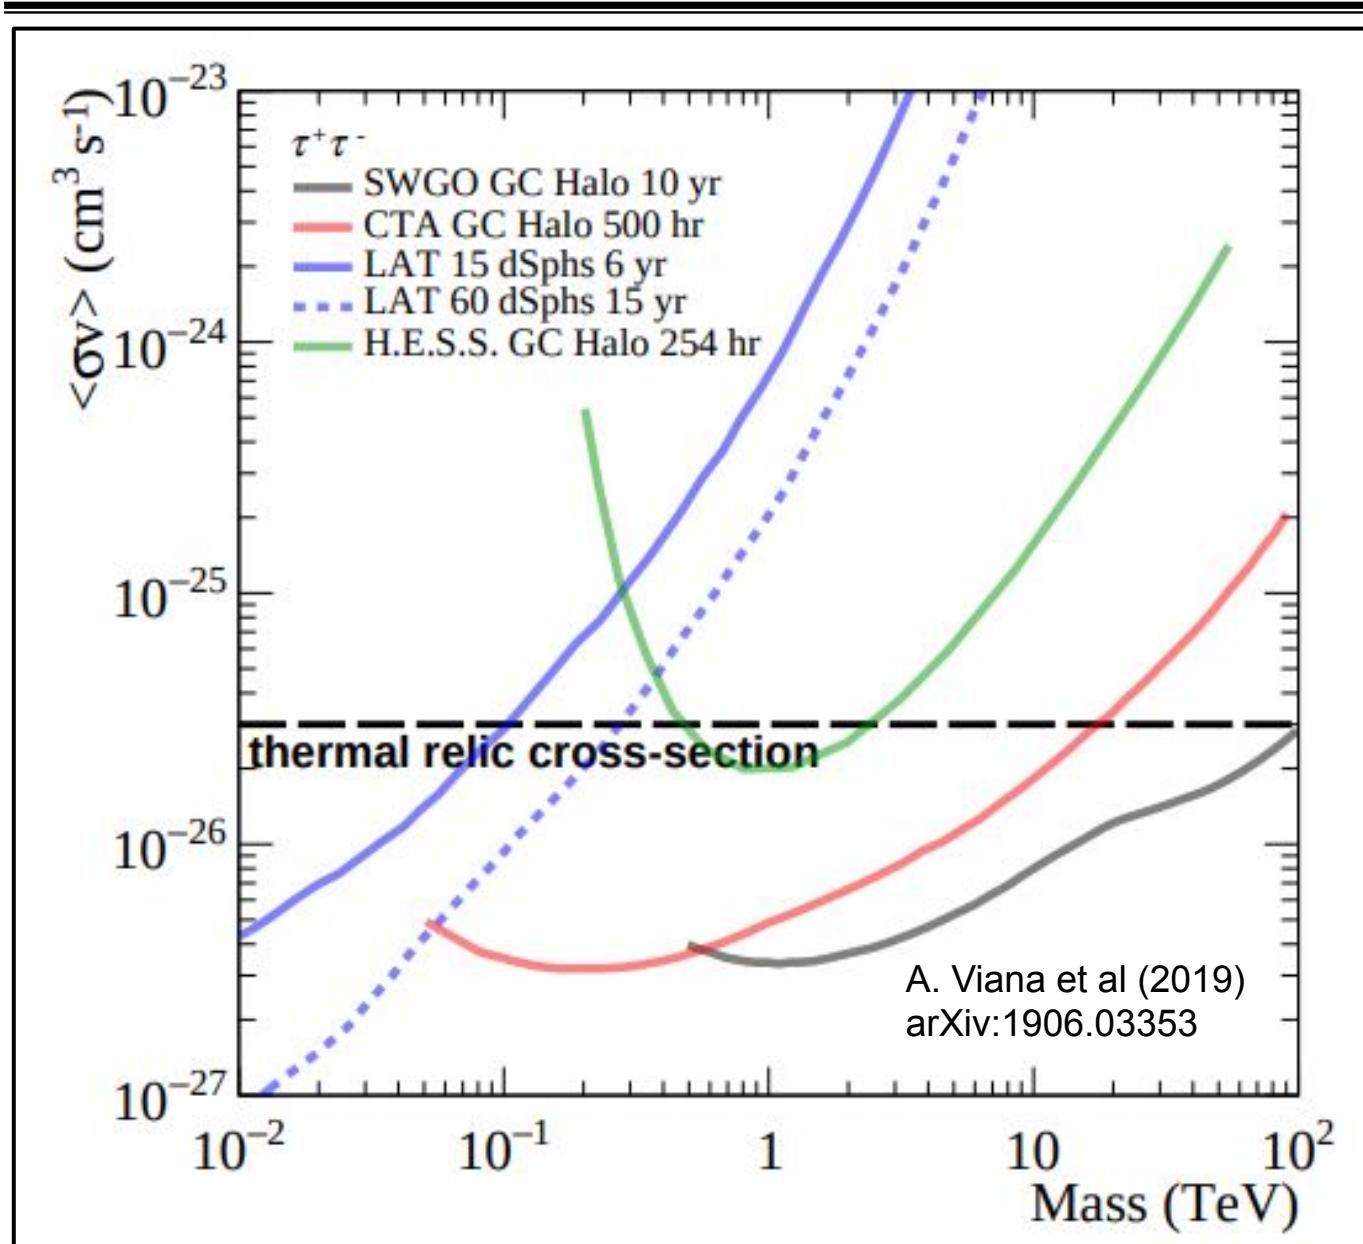

# Current WIMP Limits

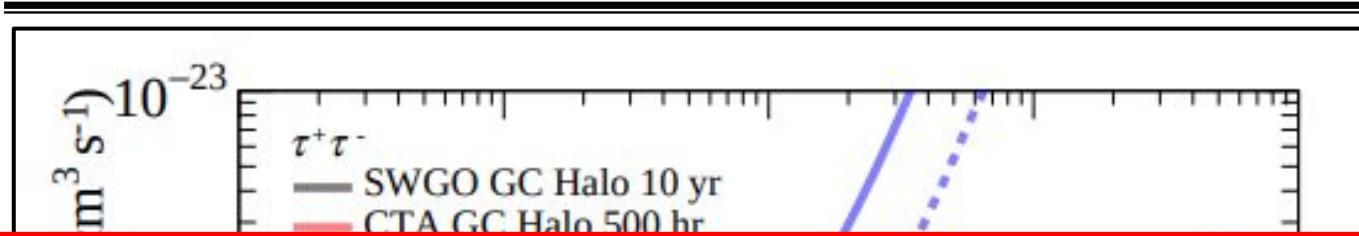

Fermi LAT limits exclude thermal WIMPs for  $m < 100$  GeV  
H.E.S.S. Galactic Center limits exclude thermal WIMPs  $\sim$ few TeV

WIMPs are not dead!

# Future DM Sensitivity

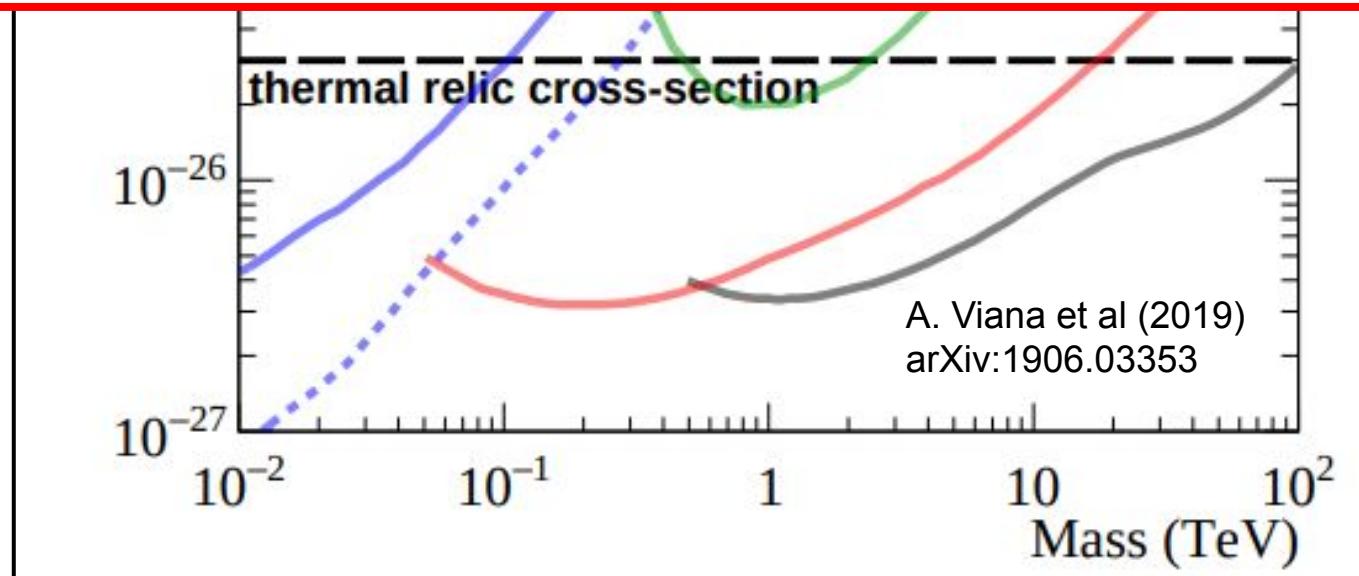

# Future DM Sensitivity

CTA and SWGO together will be able to probe thermal WIMPs up to the unitarity mass bound

CTA and SWGO have overlapping discovery space, which could result in a detection in two different observatories

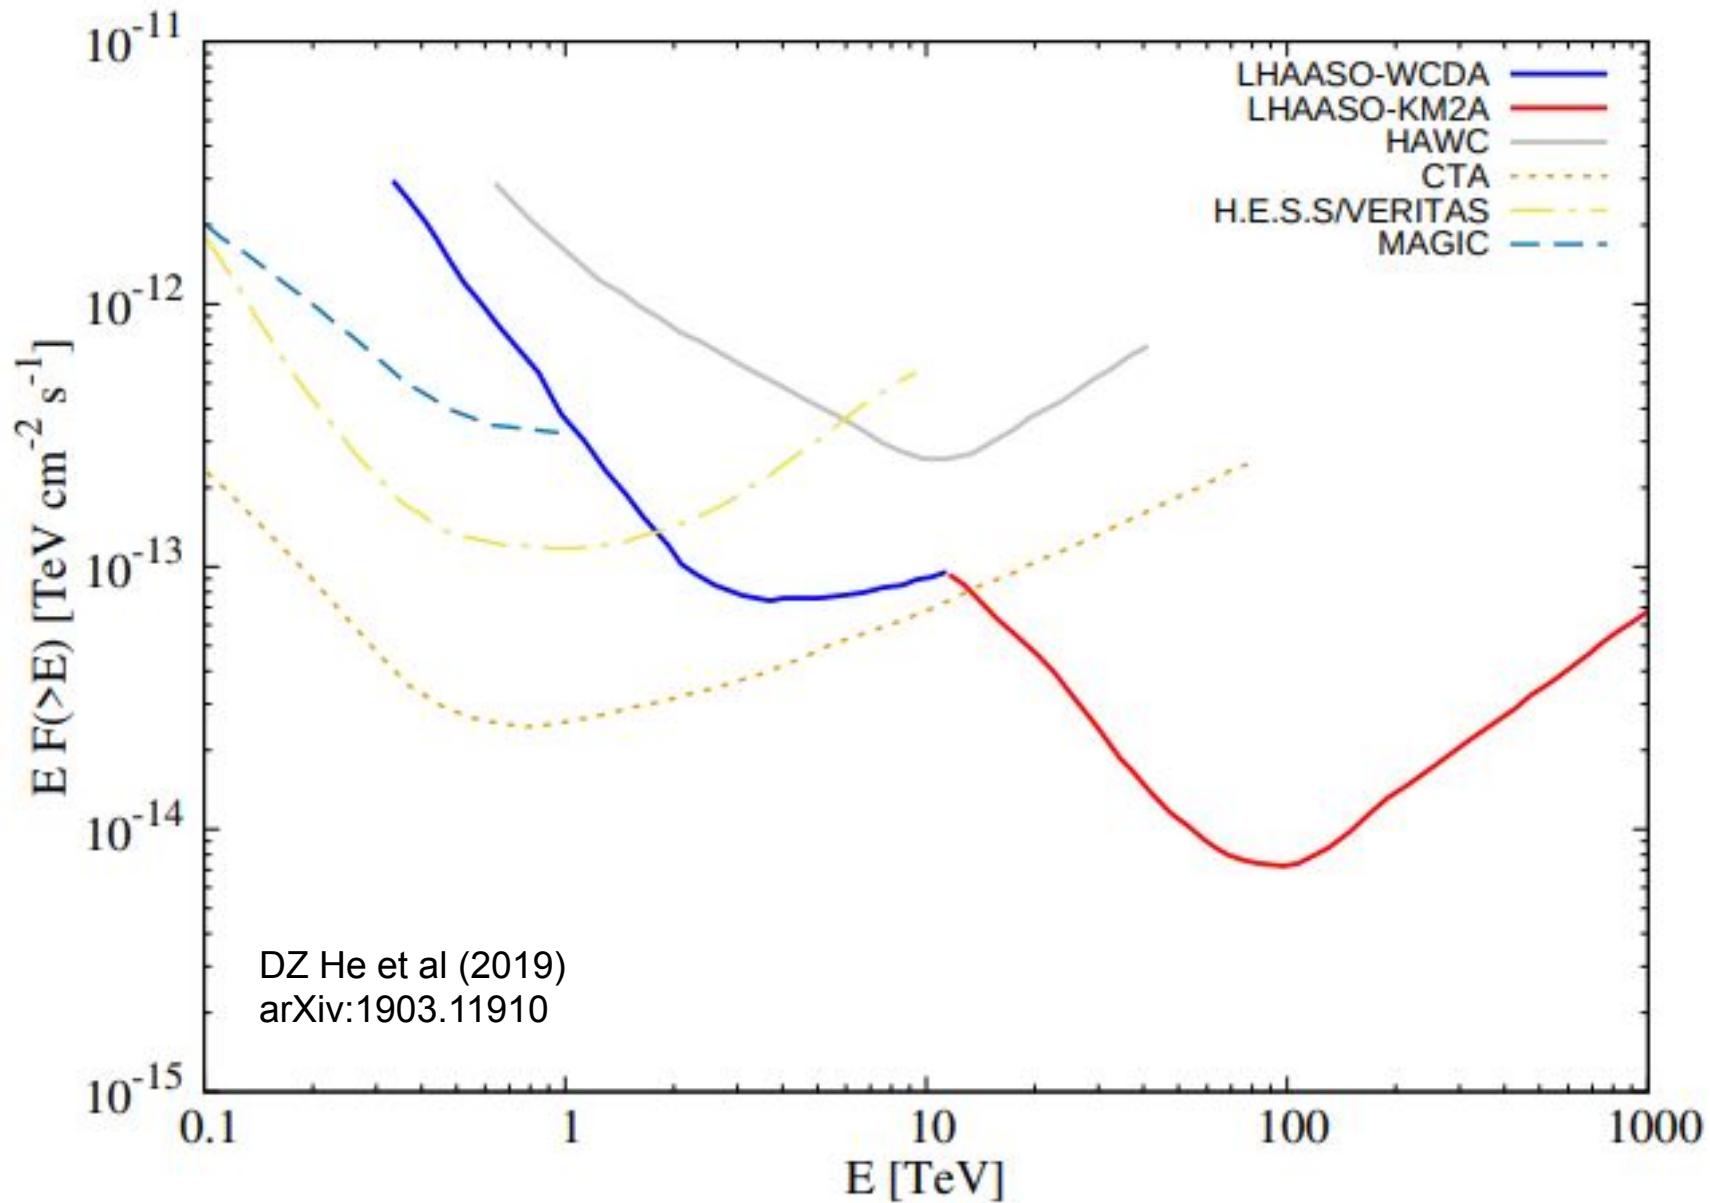

# Summary

---

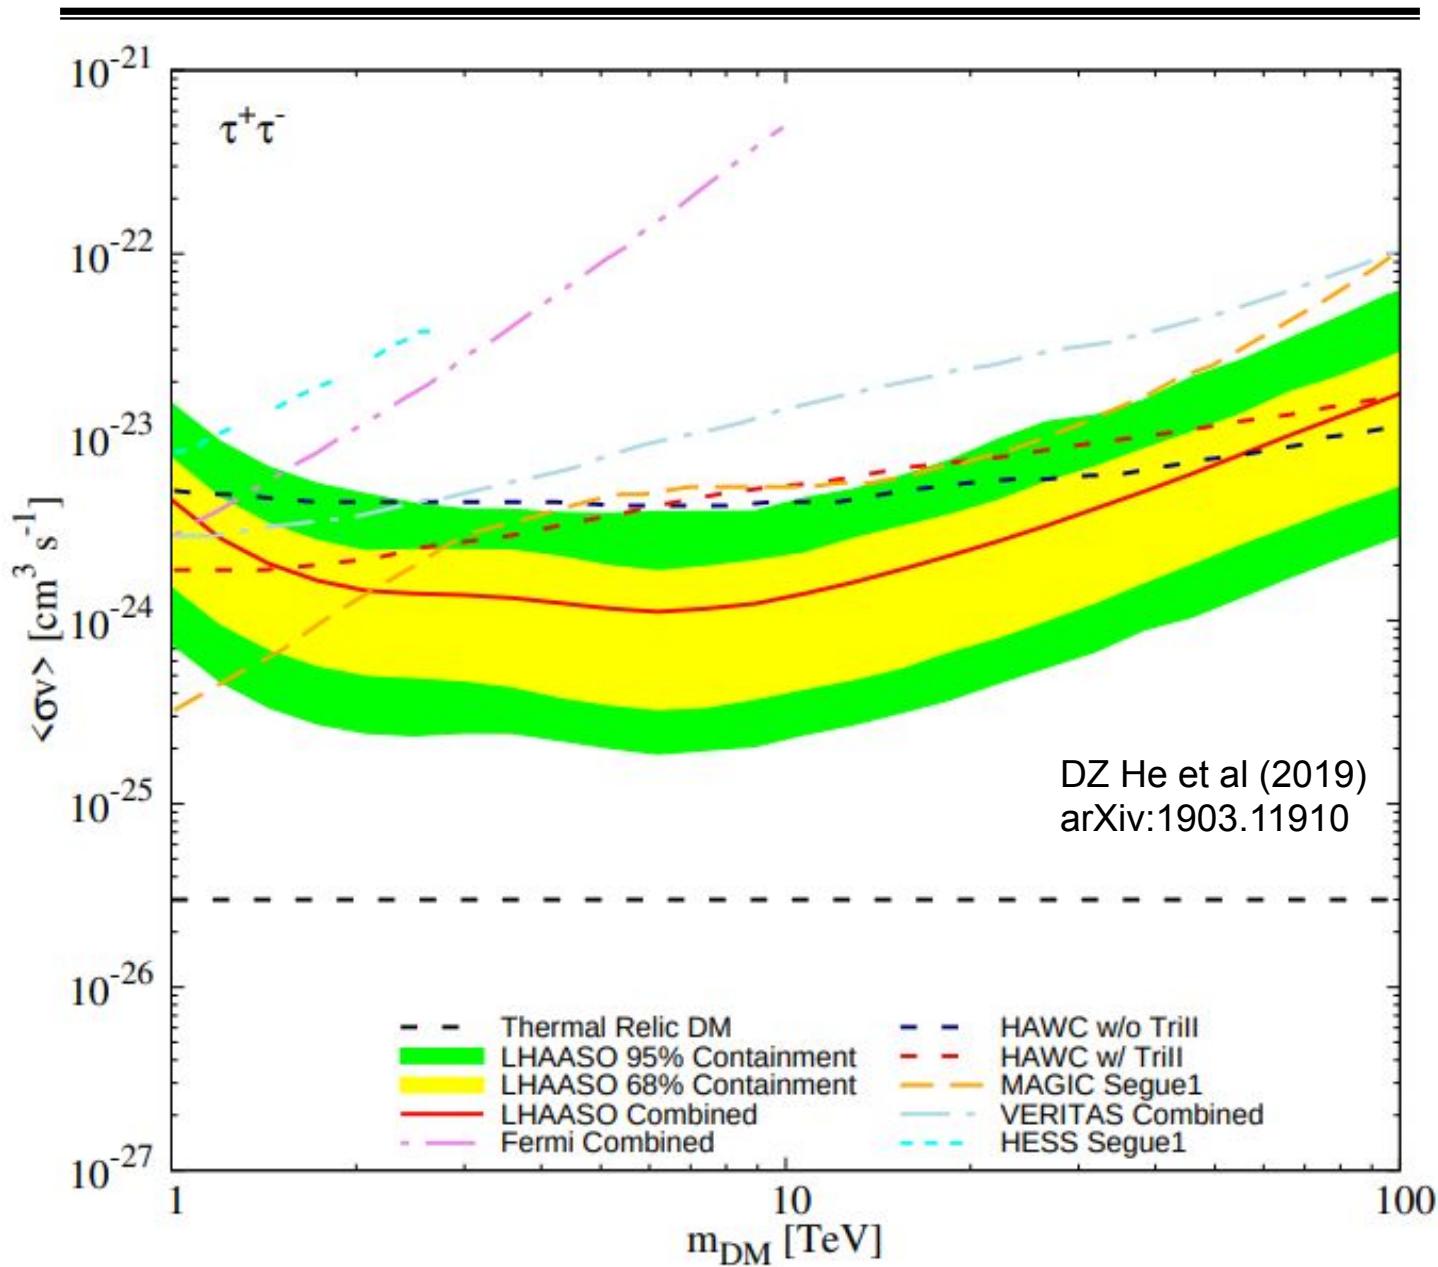

---

- Gamma rays are a unique and important probe for particle DM
  - Direct pointing allows us to focus on many dark matter rich targets
- Current and future gamma-ray observatories give a network on complementary instruments that can perform focused/deep observations as well as all sky surveys
- WIMPs are not dead!
  - Current limits exclude thermal WIMPs only for <100 GeV and  $\sim 1$  TeV
  - Only astrophysical observatories can significantly probe WIMP dark matter above  $\sim 20$  TeV in mass
- Future observatories have the opportunity to search for thermal WIMPs up to  $\sim 100$  TeV in mass

# LHAASO Sensitivity

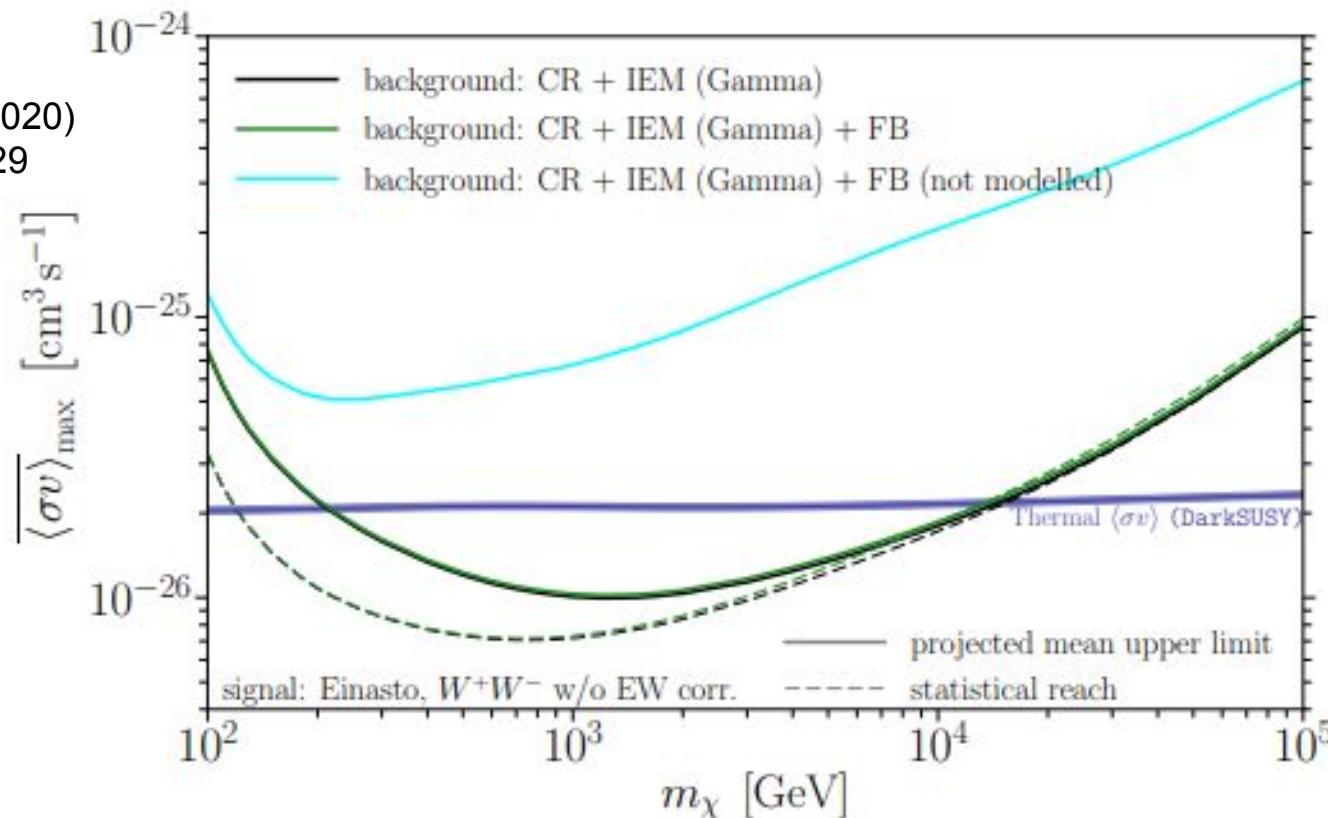

# LHAASO Expected Dwarf Limits

# CTA Galactic Halo Expected Limits

CTA Consort. (2020)  
arXiv:2007.16129

**Figure 13:** CTA sensitivity to a DM signal for our standard analysis settings (black solid line, as in Fig. 5), after adding an FB template (green solid line, largely overlapping with the black solid line) and the result of an analysis where the FB emission is present in the mock data, but not accounted for in the fitting procedure (cyan solid line). Dashed lines show the ‘statistical’ reach (neglecting systematic uncertainties in the spatial templates) for the former two cases.

# Fermi LAT Limits with 11 yrs and 27 dSphs
