

Snowmass Compressed Electroweak SUSY Kickoff
EF08: Compressed Electroweak SUSY – August 31, 2020

Jeff Shahinian
University of Pennsylvania

Mike Hance
UC Santa Cruz

Welcome!

- Compressed electroweakinos/sleptons remain highly motivated at the LHC and beyond
 - Naturalness, WIMP dark matter, muon $g - 2$
 - But difficult: low cross-section, soft final-state objects
- Significant experimental progress over last few years (just surpassing ~ 20 y/o LEP limits!)
- Snowmass: build on existing program, develop new ideas, understand physics potential of various machines
- Goal: provide forum for focused discussion and collaboration on compressed EWK SUSY models

European Strategy summary plot

- Need to assess the merits of this plot
- Monojet/disappearing track: pure higgsinos ($\Delta m \approx 350$ MeV)
- HE-LHC/FCC-hh 2ℓ : simple σ and \mathcal{L} rescaling, no reoptimization
- How can we improve existing projections?
- Where can we inject new ideas?

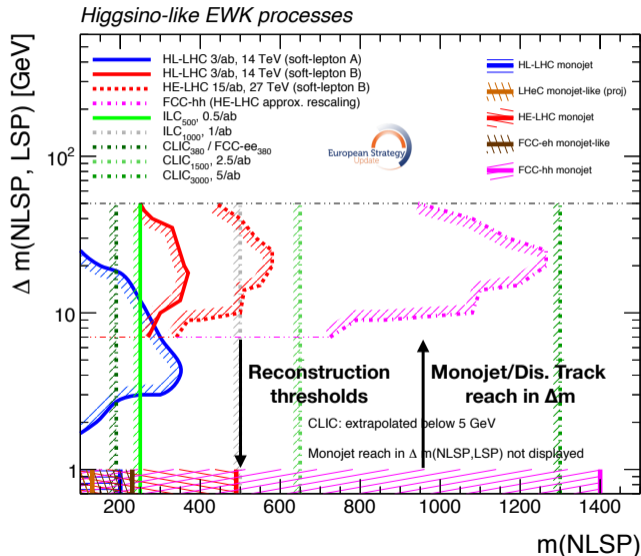

Crucial program: closing the gaps

- No attempt to determine reach in Δm from monojet/disappearing track signatures
- Maintaining low lepton reconstruction thresholds for $\Delta m \approx 1 - 10$ GeV

Inject new ideas

- Emerging LHC program of VBF production
- Novel track/soft lepton triggers
- 3ℓ final states
- ...

European Strategy: Higgsino Projections

Crucial program: closing the gaps

- No attempt to determine reach in Δm from monojet/disappearing track signatures

Beyond a "Summary Plot"

- Summary plots are just an example of collider reach, useful for organizing efforts
- But lots of interesting work to be done outside simplified model framework!
- Assessing realistic models will hopefully be important part of our Snowmass contribution

Inje

- Novel track/soft lepton triggers
- 3ℓ final states
- ...

Higgsino-like EWK processes

Near-term goals:

- Determine our background MC needs (time sensitive!)
 - ▶ Assess overlaps with EF09/EF10 (e.g. $Z(\rightarrow \nu\nu) + \text{jets}$)
 - ▶ Sufficient detector modeling for displaced/disappearing track signatures?
- Converge on benchmark signal models (electroweakinos, sleptons)
- Personpower: [SEC Project Matching Survey](#) ↗

Longer-term goals:

- Provide robust projections of sensitivity to compressed EWK SUSY
- Fill in sensitivity gaps at hadron colliders
- Identify limitations at various colliders (trigger, lepton reco. thresholds, tracker layout, etc.)
- Articulate the importance of our physics case

The Snowmass Dream:

To provide your children with a better understanding of naturalness and dark matter than you had
