

SHARING BUT NOT CARING AT COLLIDERS

N. Bernal, C. S. Fong, A. Tonero

Snowmass 2021, EF10 DM@Colliders, topical meeting

September 10, 2020

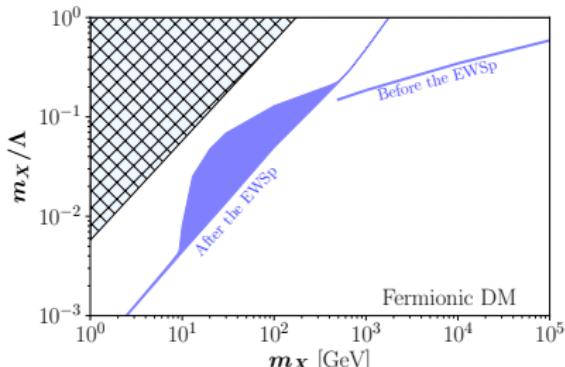

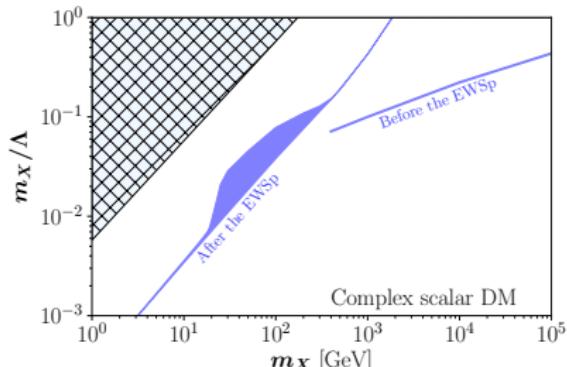

Shared asymmetry operators

- DM and SM sectors *share* a common B or $B - L$ asymmetry through [N.Bernal, C. S. Fong, N. Fonseca, JCAP 1609 (2016) no.09, 005]

$$\frac{1}{\Lambda^{5-p}} \mathbf{X} \mathbf{X} \epsilon_{ik} \epsilon_{jl} (l_L^i l_L^j) (H^k H^l) \quad (\text{Before EWSph})$$

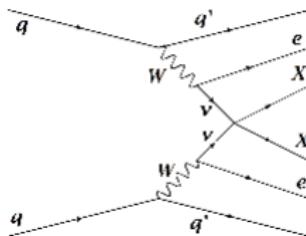

$$\frac{1}{\Lambda^{6-p}} \mathbf{X} \mathbf{X} \epsilon_{abc} \epsilon_{ij} (q_L^{ia} l_L^j) (d_R^b u_R^c) \quad (\text{After EWSph})$$

- fix $m_X > 1$ GeV $\Rightarrow 1/\Lambda$ is determined by the requirement of correct DM abundance and Baryon asymmetry $\Rightarrow 0.5$ TeV $\lesssim \Lambda \lesssim 10$ TeV

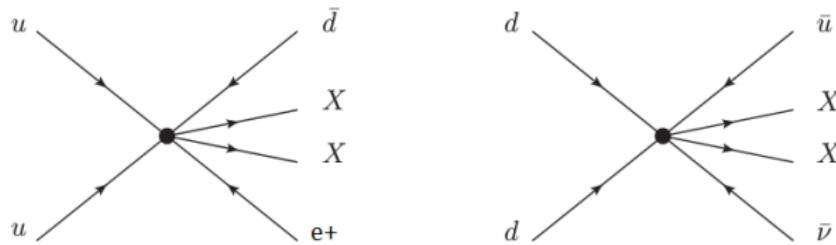

Collider signatures

- First operator gives rise to $pp \rightarrow e^\pm e^\pm XX jj$

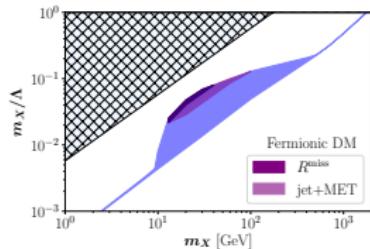

- Second operator gives rise to $pp \rightarrow j e^+ XX$ and $pp \rightarrow j \nu XX$

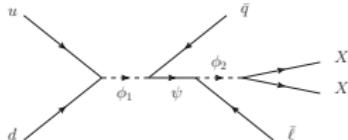

Proposed study

- Some constraints obtained from recasting jet+MET at 13 TeV
[N.Bernal, C. S. Fong, A. Tonero, JHEP 08 (2018) 037]

- Look for $pp \rightarrow e^\pm e^\pm XX jj$ (recasting VBF or dedicated search) and $pp \rightarrow je^+ XX$ (recasting $W+1$ jet or dedicated *monolepton+monojet+MET* search) at HL-LHC
- EFT validity \Rightarrow simplified models \Rightarrow other signatures ($gg, qq \rightarrow \phi_1 \phi_1, \phi_1 \rightarrow jj, e^+ e^- \rightarrow \gamma + \text{MET}, \dots$)

Thank you
