

ECAL: Barrel vs. endcap studies

Vivek Jain

SUNY Albany

Feb 16, 2021

Introduction

Old geometry

TPCFidRadius = 222.5;
TPCFidLength = 215.;

TPCRadius = 273.;
TPCLength = 259.;

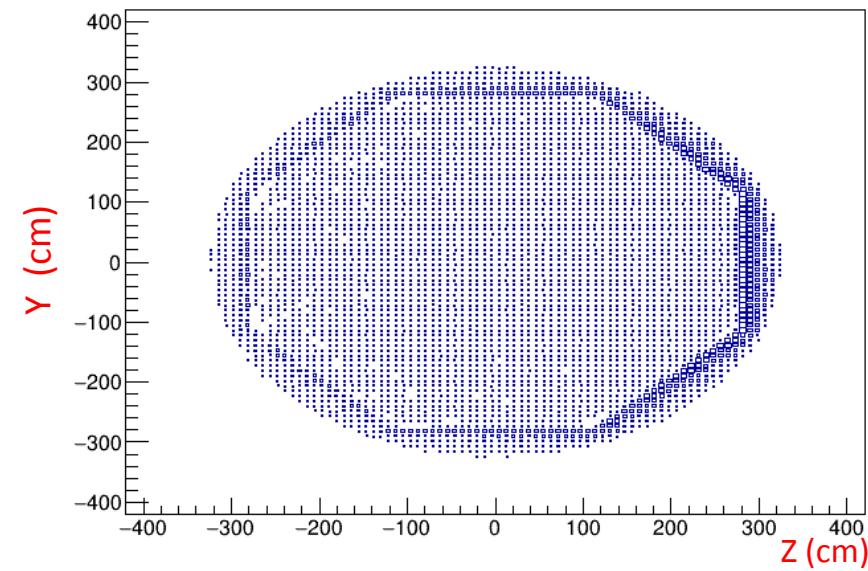

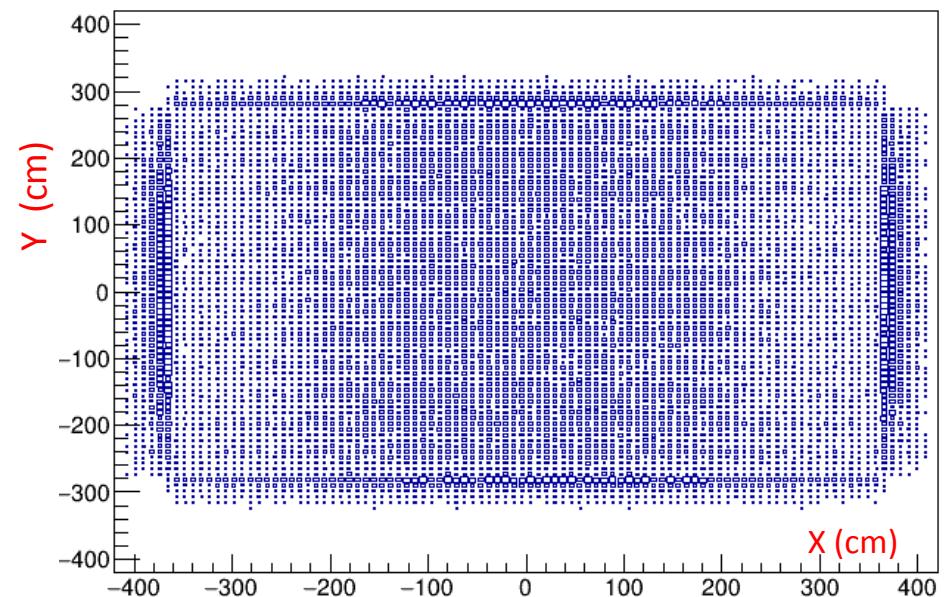

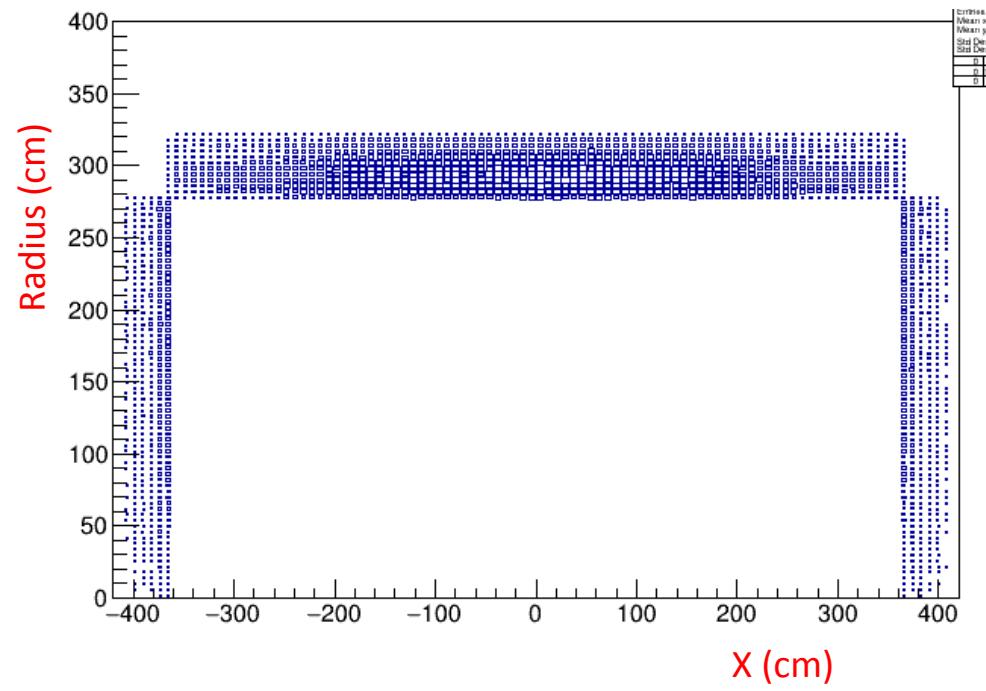

ECALInnerRadius = 278.;
ECALOuterRadius = 321.;

ECALStartX = 364.;
CALEndX = 406.;

Here I am looking at energy in the endcaps and the barrel

These plots help answer a question that Alan asked, i.e., what if there is no endcap ECAL, and instead we just have a long barrel - In this older geometry, the barrel ECAL is ~ 7.2 m long

Eldwan is making files with the latest geometry

Positions of particles that STOP in the ECAL

Neutrino interaction is constrained to be in the TPC fiducial volume

Aggregated over all modes, neutrino flavors (FHC)

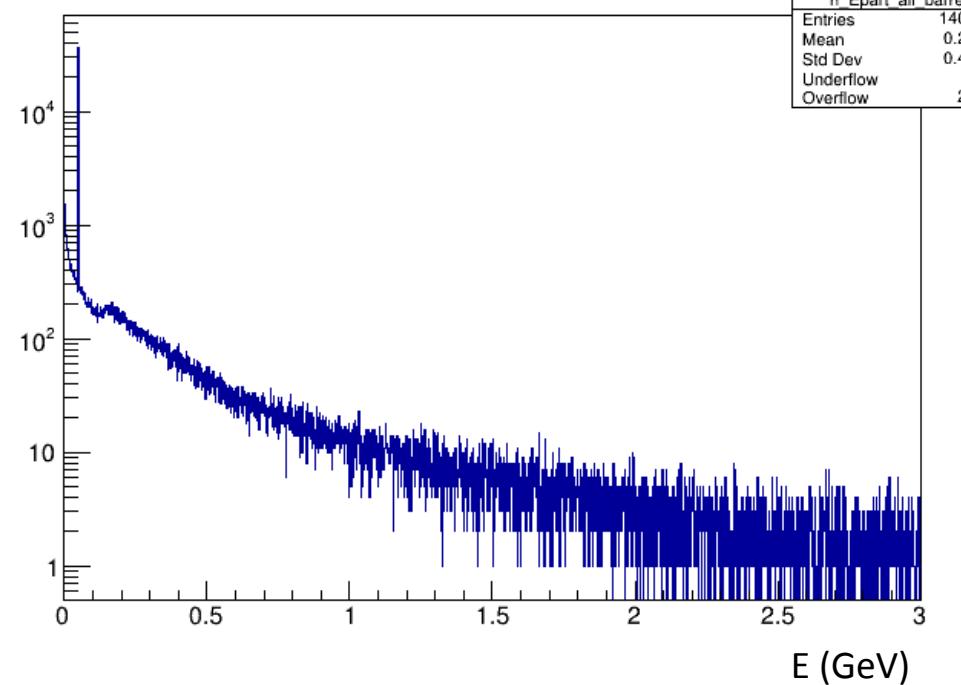

Neutrino event vertex is within the TPC Fiducial volume

One entry per particle – only use primary particles from neutrino event (instead of primary π^0 , use their daughter photons)

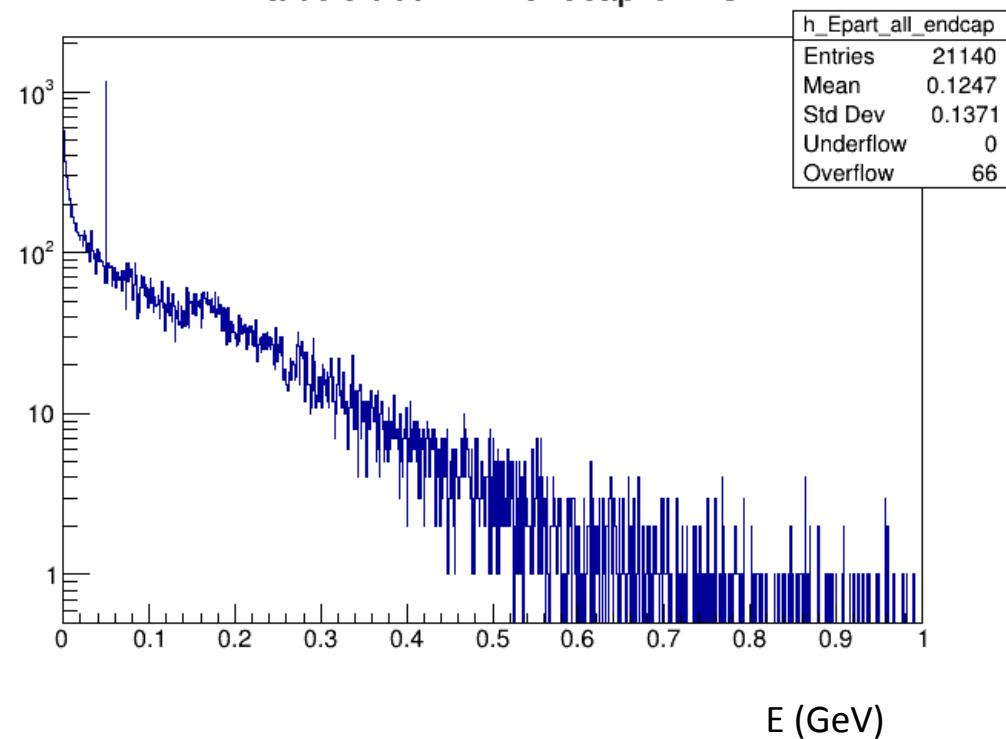

Energy of particles that stop in or go through the CALO (the spike at 49 MeV is due to through-going charged particles)

Using truth information in all plots

Particle truth E in barrel CALO

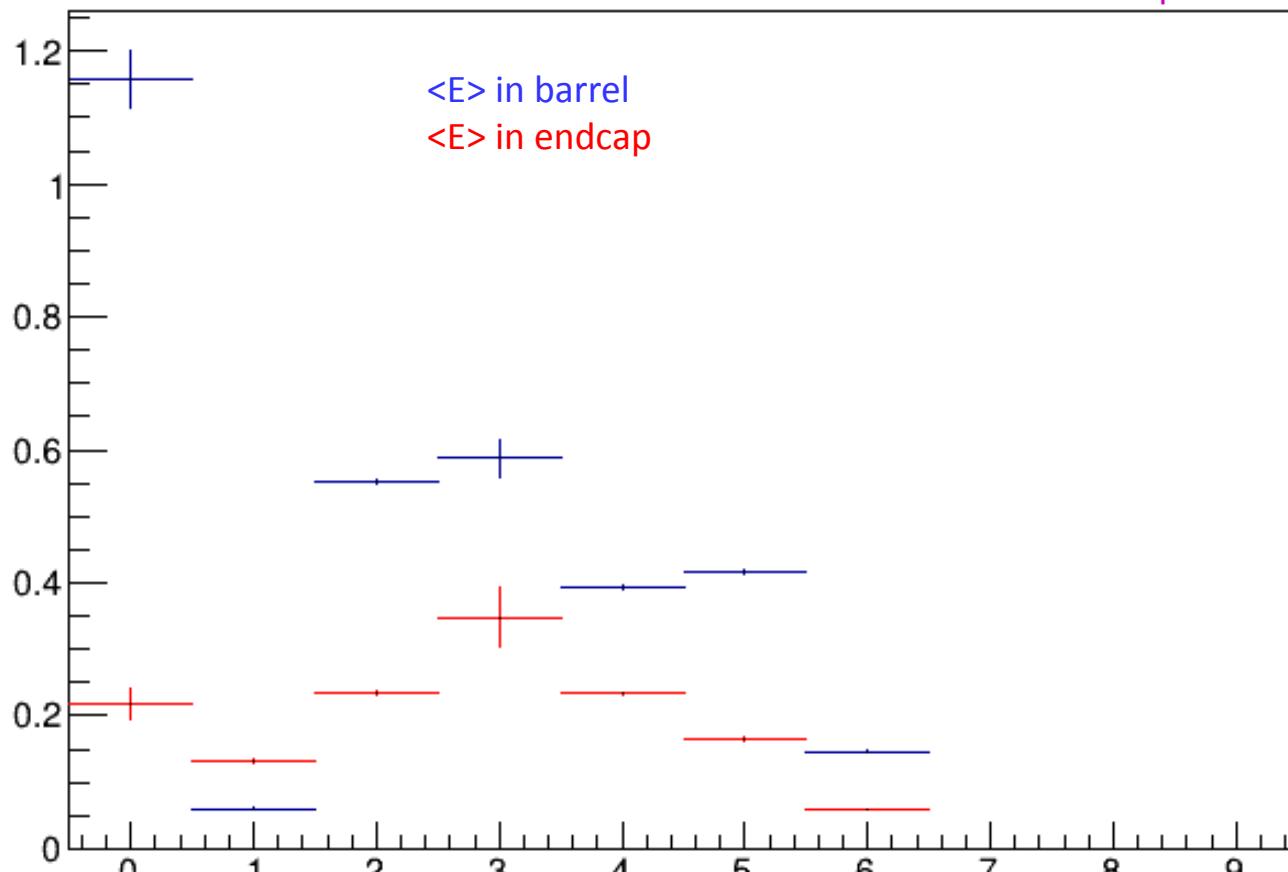

Particle truth E in endcap CALO

Currently, E means KE for all particles – will be fixed in the new files.

Profile plots

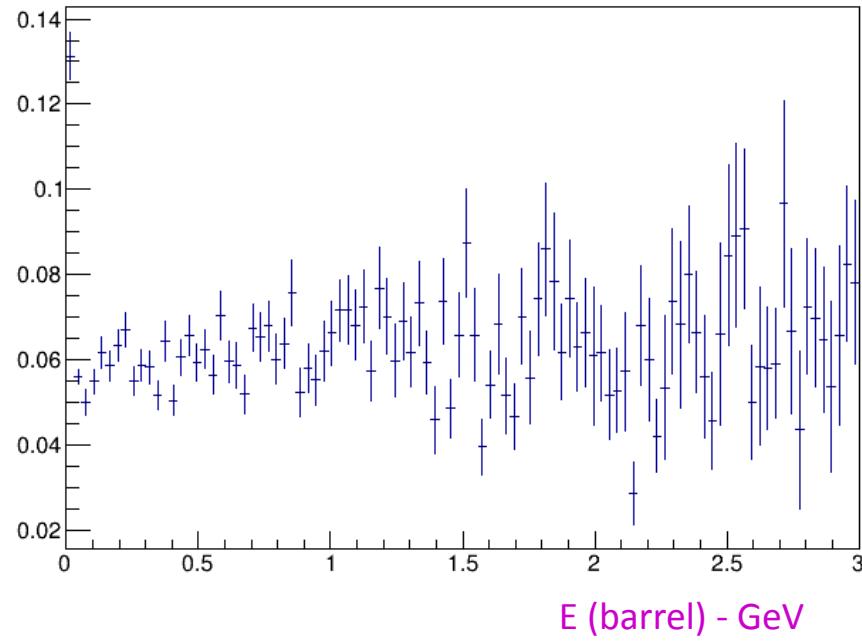

In general, less energy is deposited in the endcaps compared to barrel

$\langle E \rangle$ for muons is higher in the endcaps – I think that's because more of them actually stop in the endcap CALO, and deposit all their energy rather than go through and deposit only 49 MeV

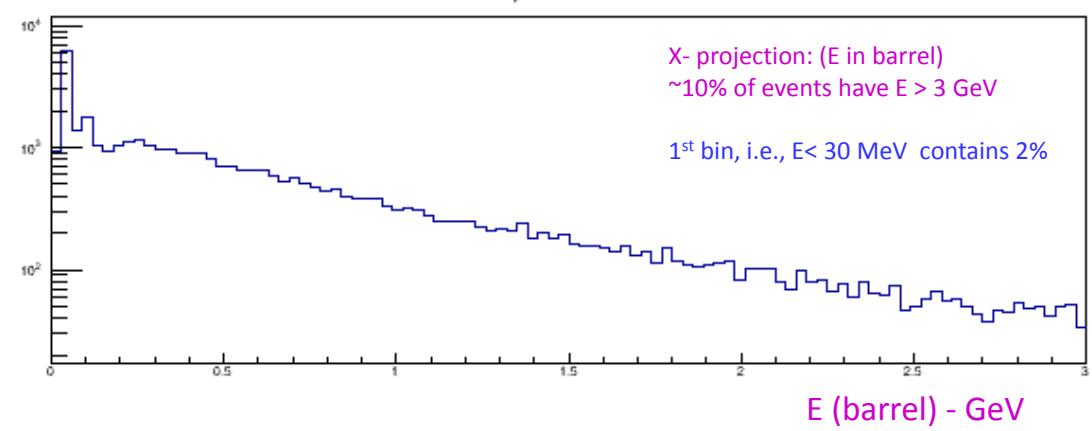

0 – electron, 1 – muon, 2 – charged pion, 3 – charged kaon, 4 – proton, 5 – photon, 6 – neutron

Event level plots – one entry/event - filled when Total Energy in either barrel or endcap > 0 – (97% of the events satisfy this)

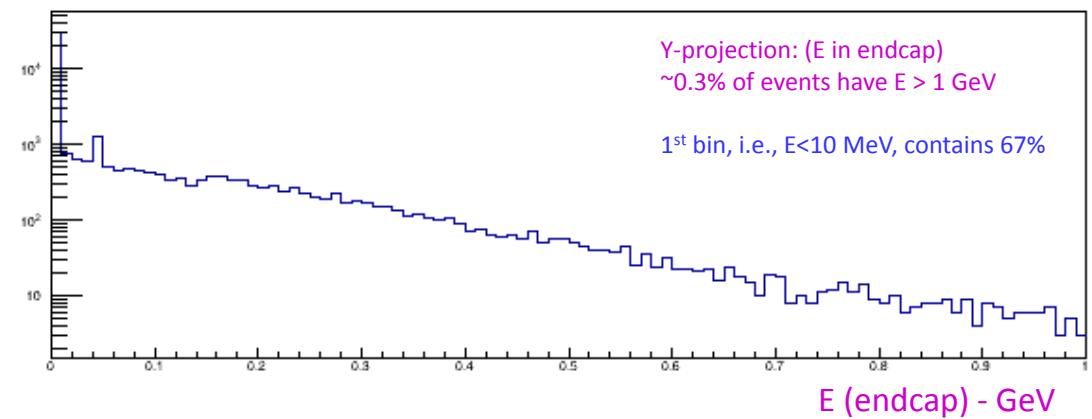

X-profile plot

Total truth E in endcap vs. barrel CALO - nonzero case

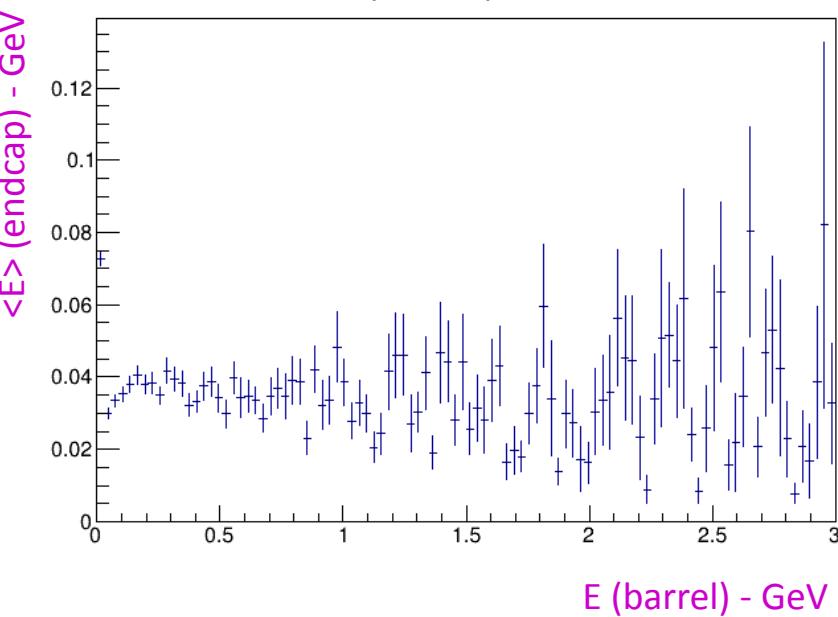

Total truth E in endcap vs. barrel CALO - nonzero case

The first X-bin has $\langle E \rangle$ in endcap ~ 0.13 GeV,
everywhere else ~ 60 MeV

Event level plots – one entry/event – filled when Neutral Energy* in either barrel or endcap > 0 – (67% of the events satisfy this)

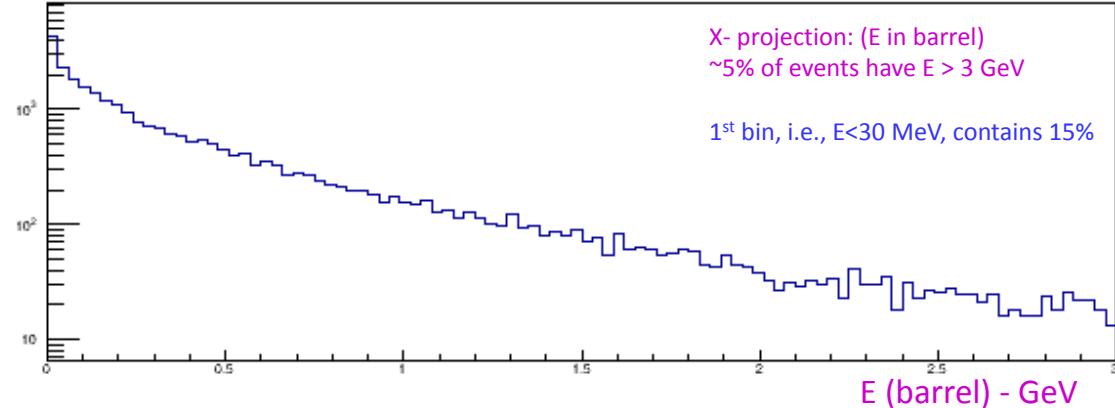

X-profile plot

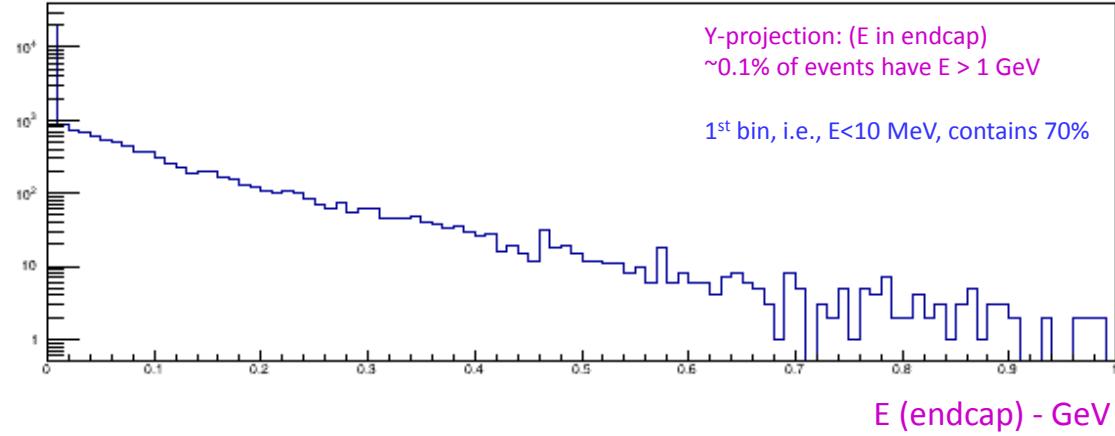

The first X-bin has $\langle E \rangle$ in endcap ~ 75 MeV,
everywhere else ~ 40 MeV

*Neutral Energy means photons + neutrons

Neutron+gamma E in endcap vs. barrel CALO - nonzero

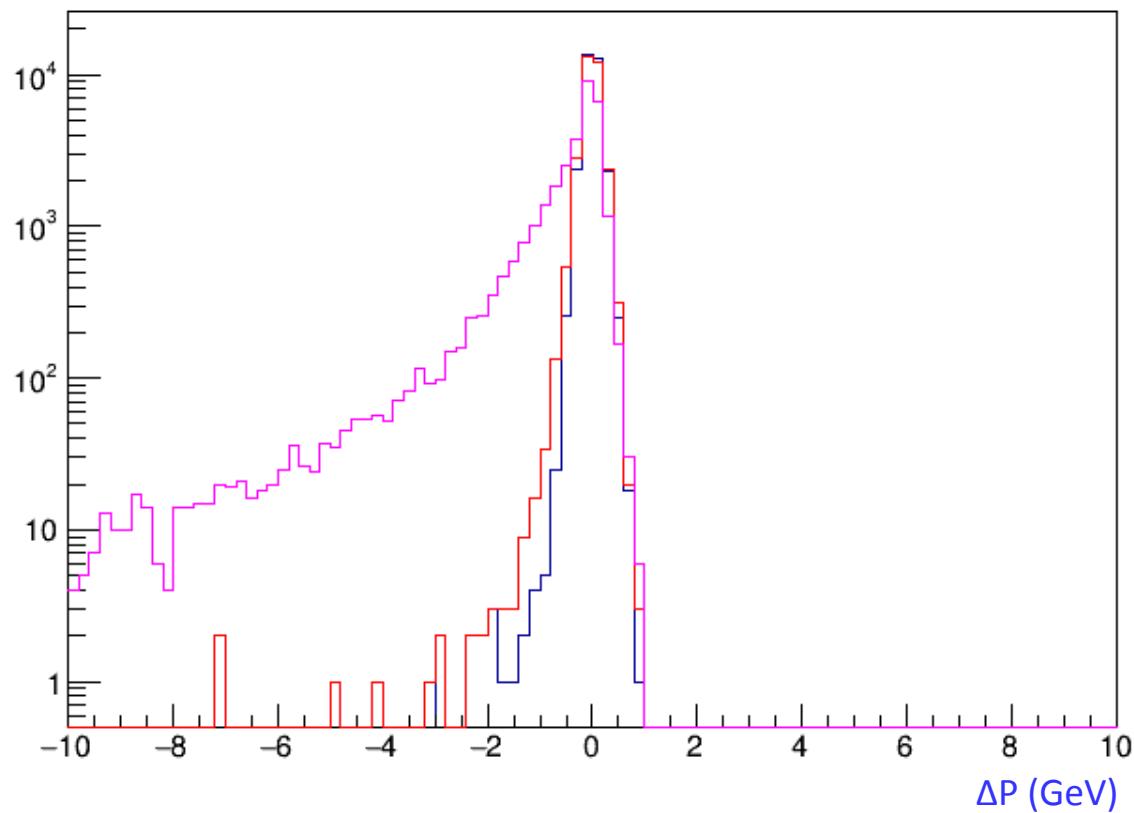

Neutron+gamma E in endcap vs. barrel CALO - nonzero

Benchmark studies – use ΔP as a metric – CC ν_μ events

$$\Delta P = |\text{Vector sum of } P \text{ of outgoing primaries}| - |p_{\text{Inc.neutrino}}|$$

Sum(P_{prim})-Ptrue for incoming neutrino

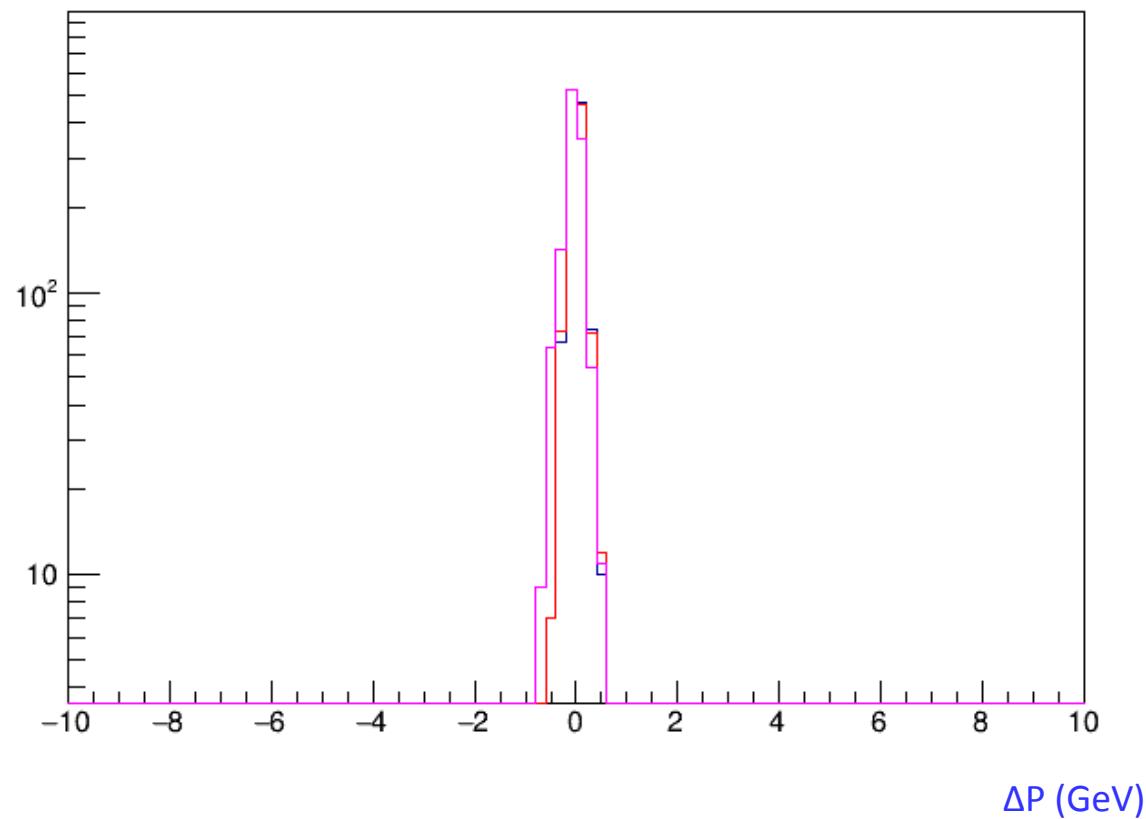

Using all primaries

Using all primaries excluding neutrons & photons that stop in Endcap ECAL

Using all primaries excluding neutrons & photons that stop in Barrel ECAL

Benchmark studies – use ΔP as a metric – CC ν_μ events ($E_\nu < 1$ GeV – 4%)
 $\Delta P = |\text{Vector sum of } P \text{ of outgoing primaries}| - |p_{\text{Inc.neutrino}}|$

Sum(P_{prim}) $-P_{\text{true}}$ for incoming neutrino

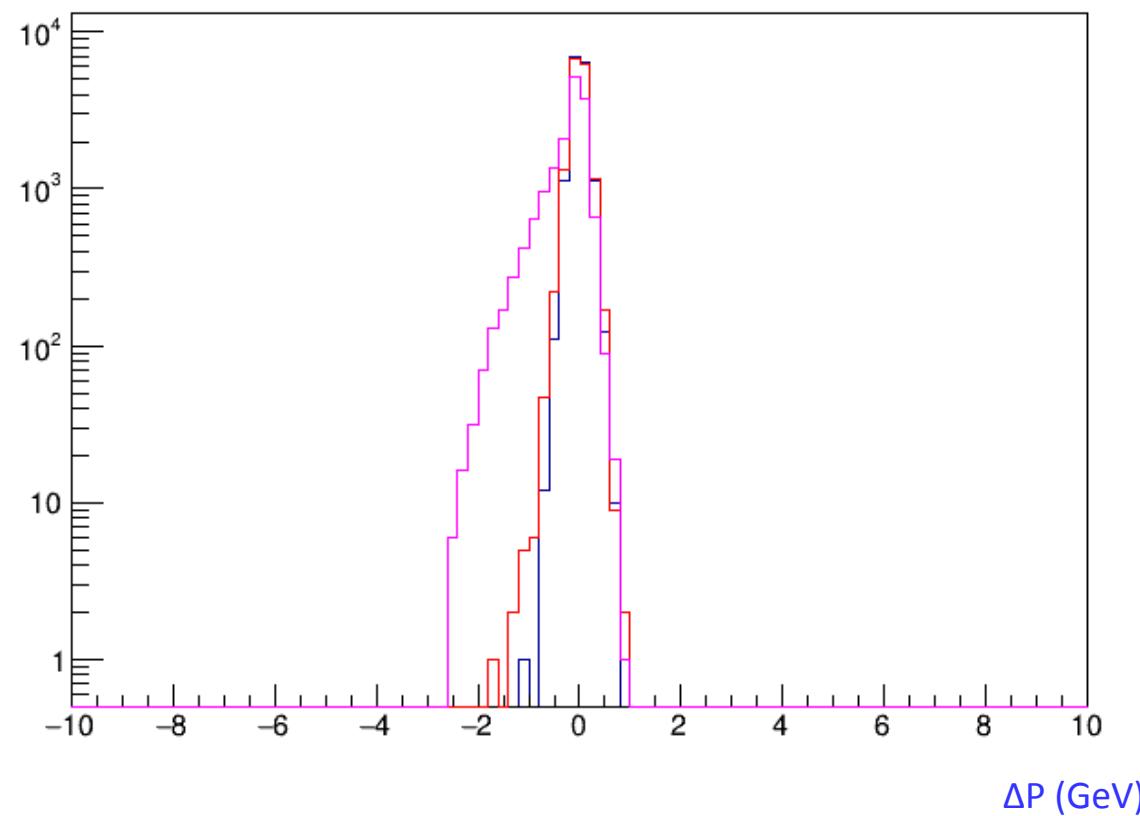

Using all primaries

Using all primaries excluding neutrons & photons that stop in Endcap ECAL

Using all primaries excluding neutrons & photons that stop in Barrel ECAL

Benchmark studies – use ΔP as a metric – CC ν_μ events (E_ν : 1-3 GeV – 50%)
 $\Delta P = |\text{Vector sum of } P \text{ of outgoing primaries}| - |p_{\text{Inc.neutrino}}|$

Sum(P_{prim})-Ptrue for incoming neutrino

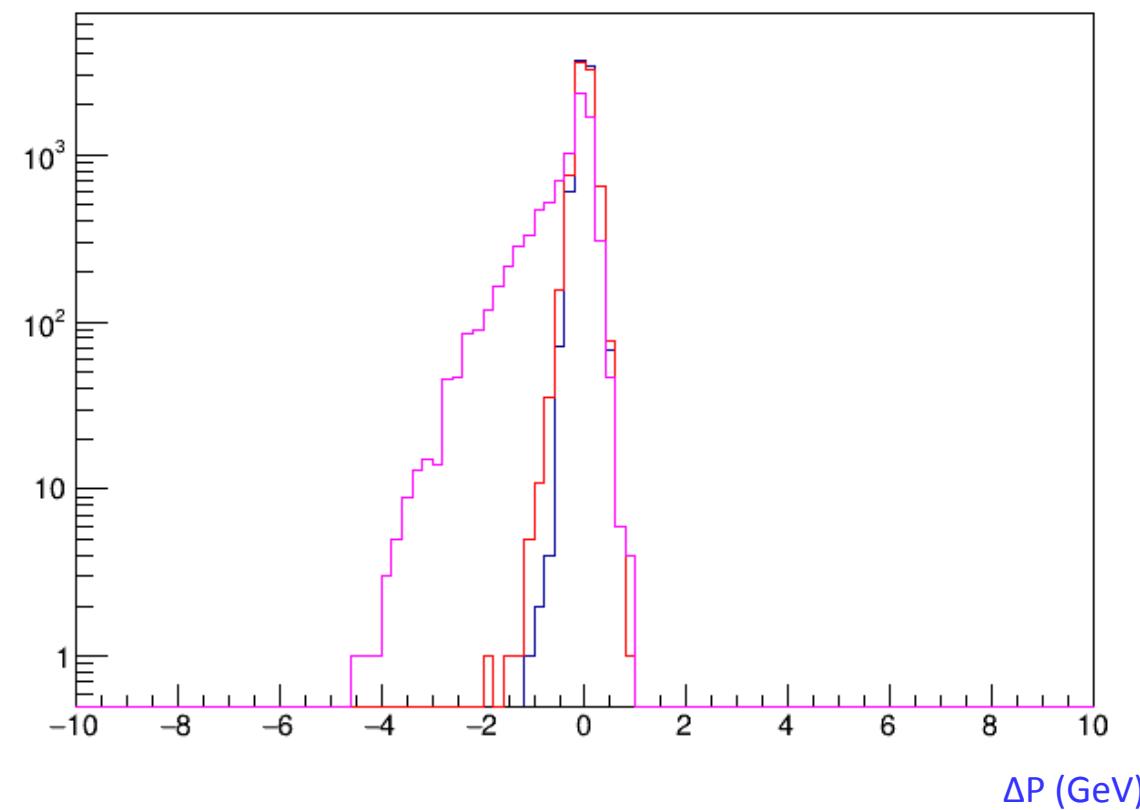

Using all primaries

Using all primaries excluding neutrons & photons that stop in Endcap ECAL

Using all primaries excluding neutrons & photons that stop in Barrel ECAL

Benchmark studies – use ΔP as a metric – CC ν_μ events (E_ν : 3-5 GeV – 27%)
 $\Delta P = |\text{Vector sum of } P \text{ of outgoing primaries}| - |p_{\text{Inc.neutrino}}|$

Sum(P_{prim})- P_{true} for incoming neutrino

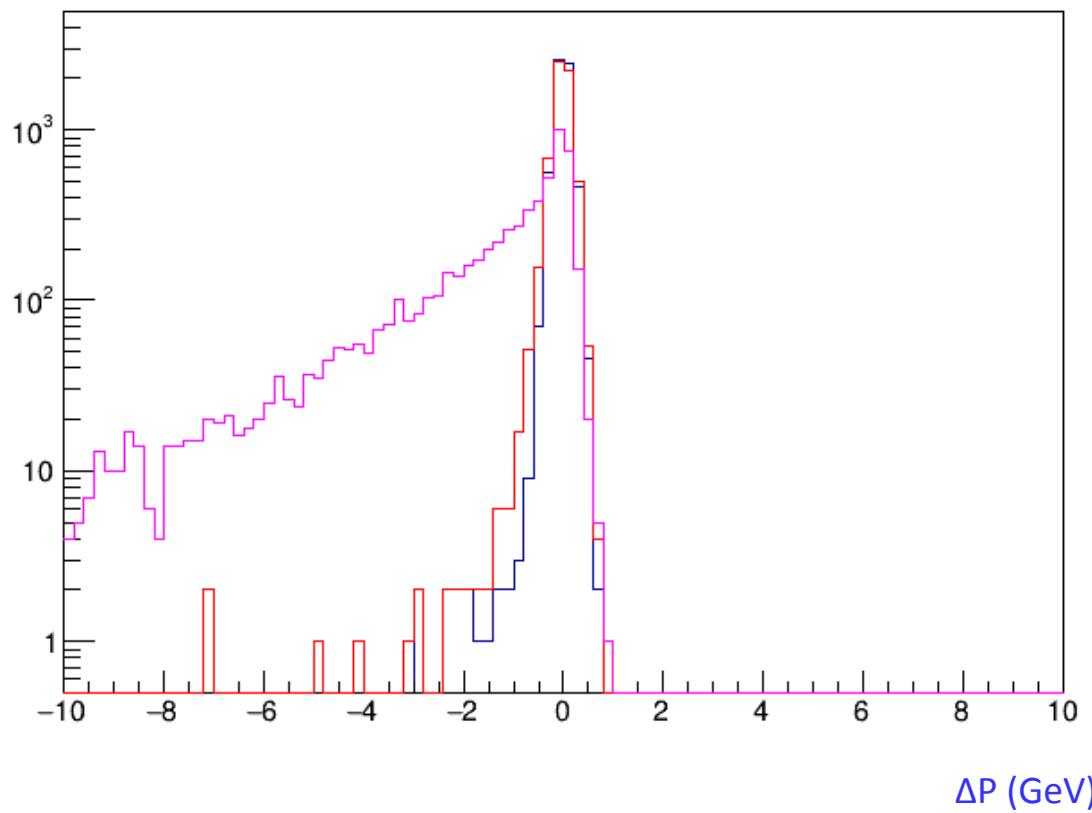

Using all primaries

Using all primaries excluding neutrons & photons that stop in Endcap ECAL

Using all primaries excluding neutrons & photons that stop in Barrel ECAL

Benchmark studies – use ΔP as a metric – CC ν_μ events ($E_\nu: > 5 \text{ GeV} - 20\%$)
 $\Delta P = |\text{Vector sum of } P \text{ of outgoing primaries}| - |p_{\text{Inc.neutrino}}|$

Sum(P_{prim})-Ptrue for incoming neutrino

Using all primaries

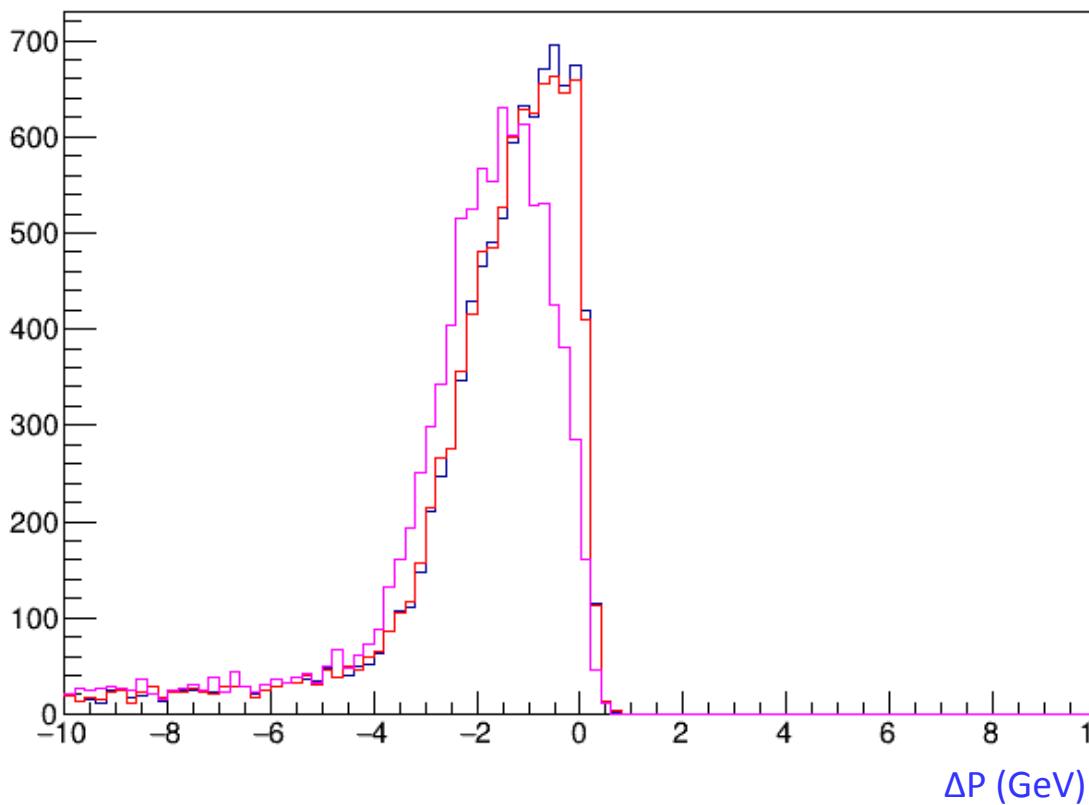

Using all primaries excluding neutrons & photons that stop in Endcap ECAL

Using all primaries excluding neutrons & photons that stop in Barrel ECAL

Benchmark studies – use ΔP as a metric – NC ν_μ events

$$\Delta P = |\text{Vector sum of } P \text{ of outgoing primaries (excl. neutrino)}| - |p_{\text{Inc.neutrino}}|$$

Sum(P_{prim})-Ptrue for incoming neutrino

Using all primaries – except the outgoing neutrino

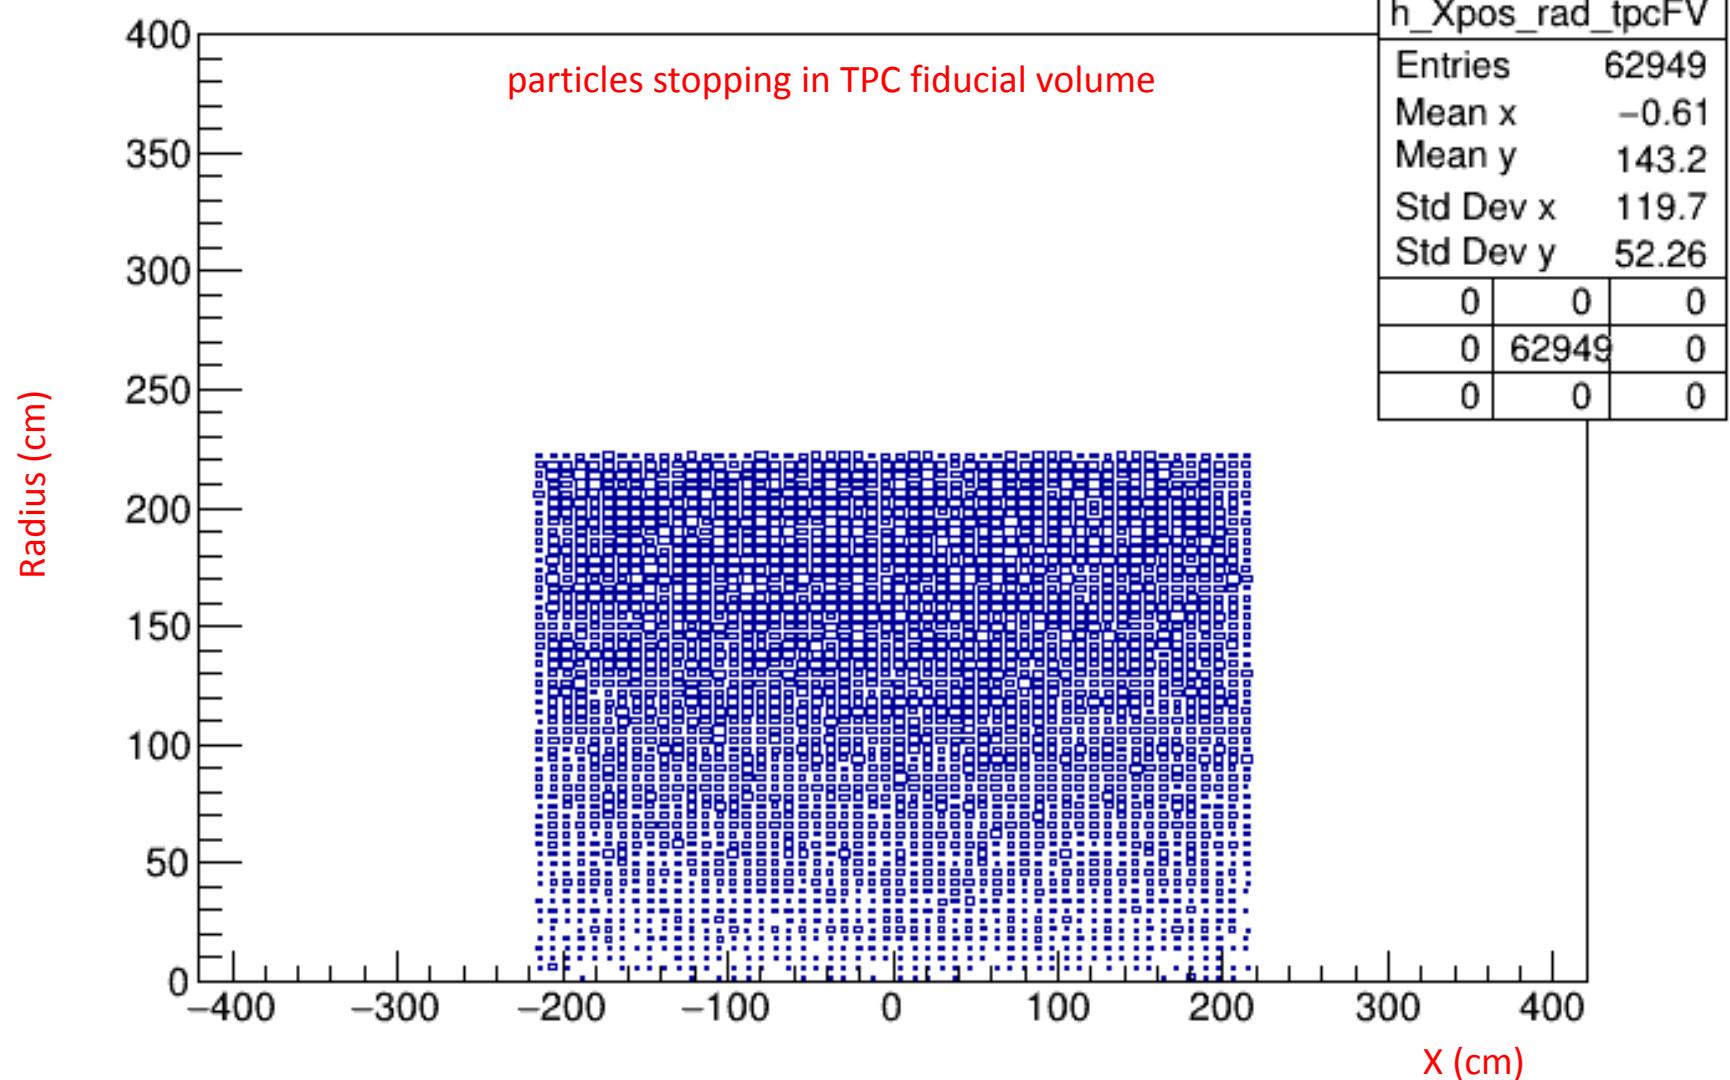

Using all primaries excluding neutrons & photons that stop in Endcap ECAL

Using all primaries excluding neutrons & photons that stop in Barrel ECAL

(Interesting that the “noBarrel” distribution is different Between CC and NC events – not sure why)

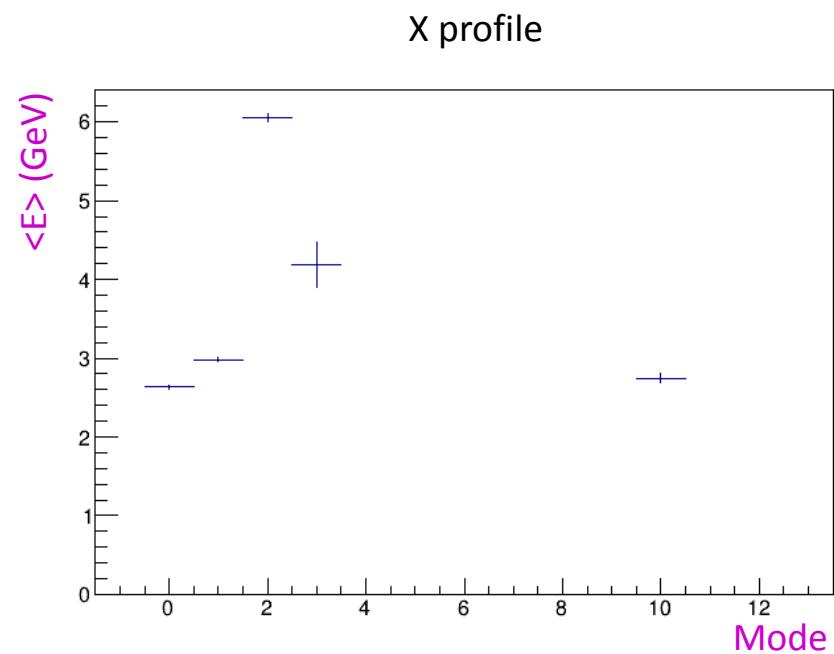

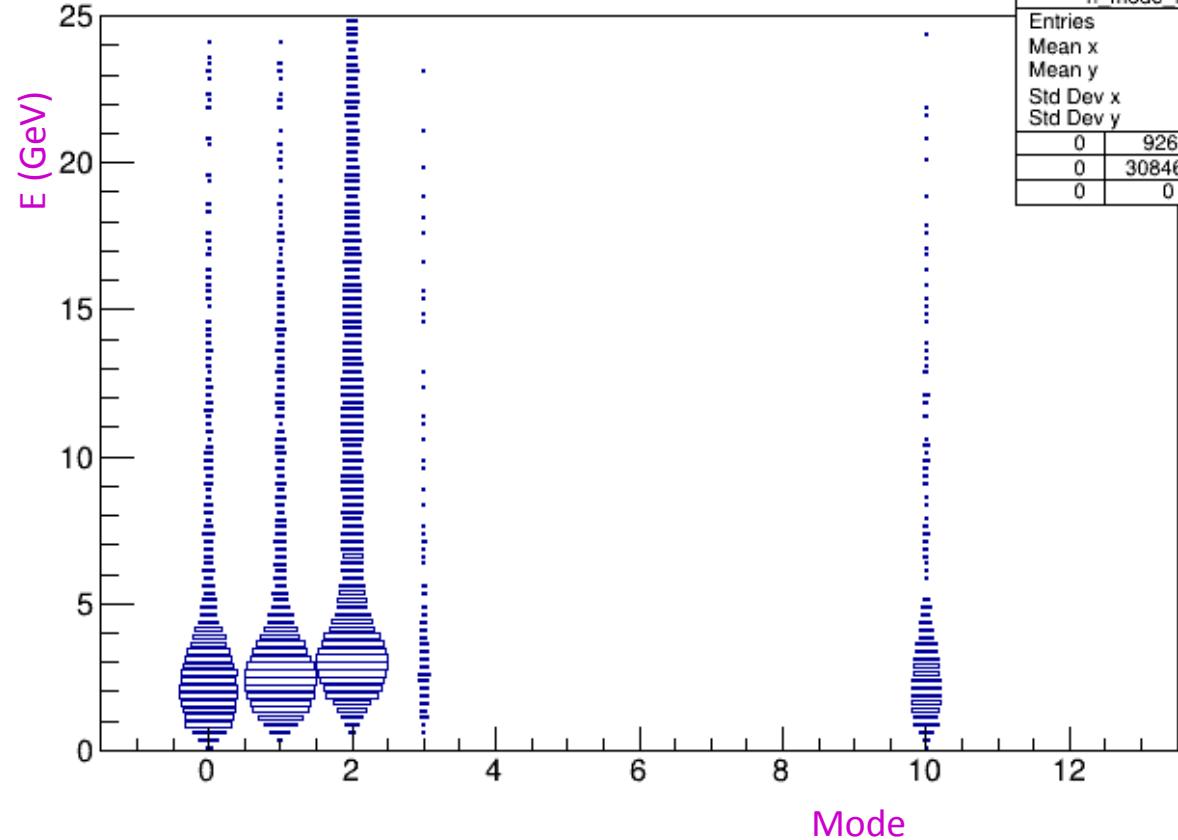

Extra slides

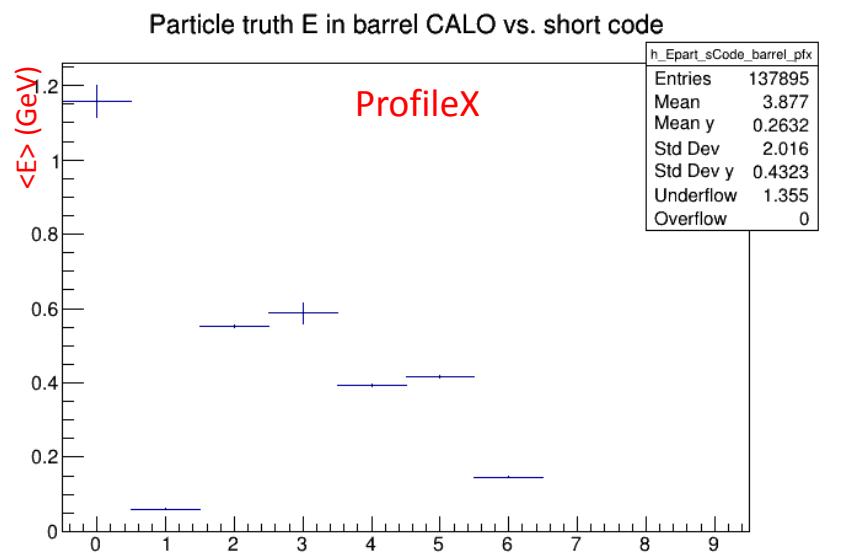

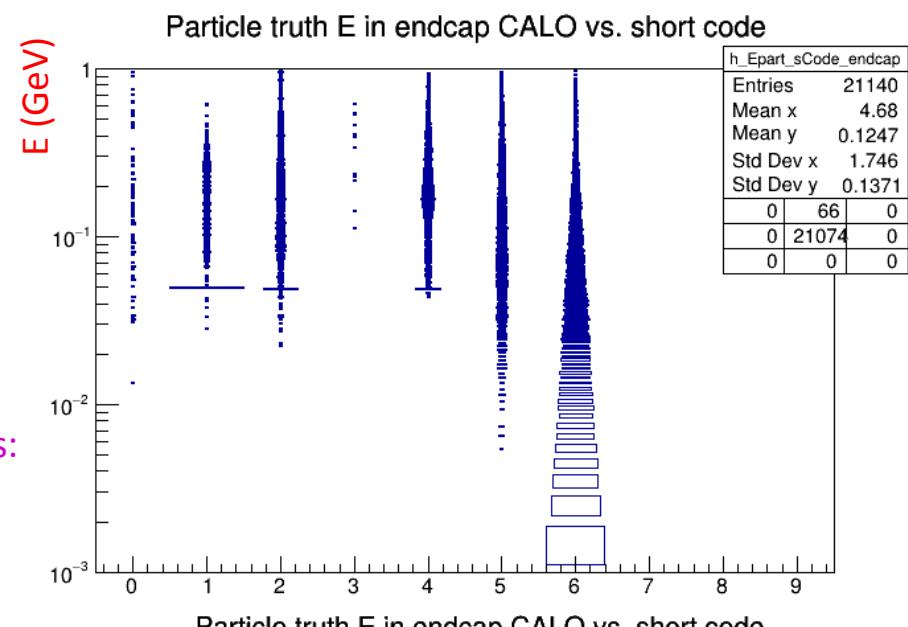

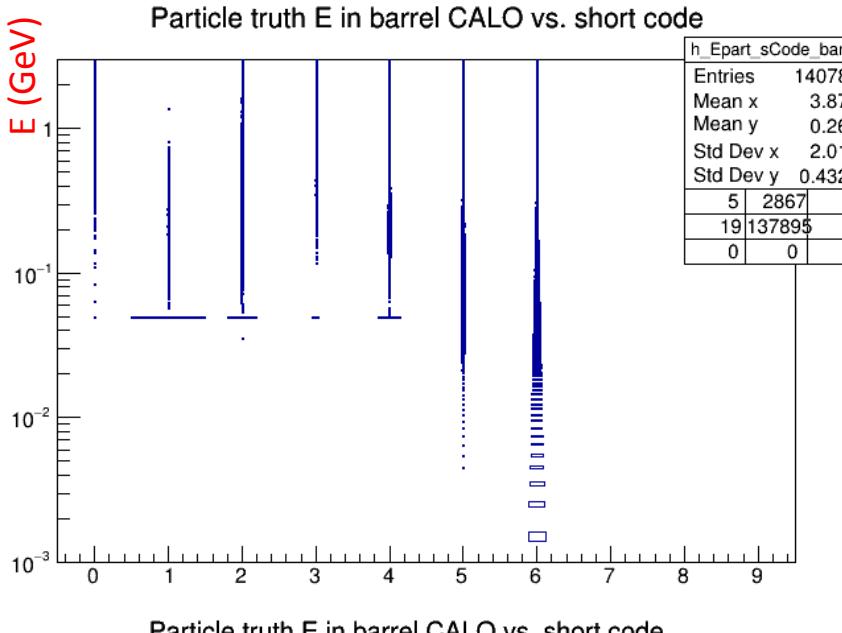

Stopping rad. vs. Xpos

CC ν_μ events

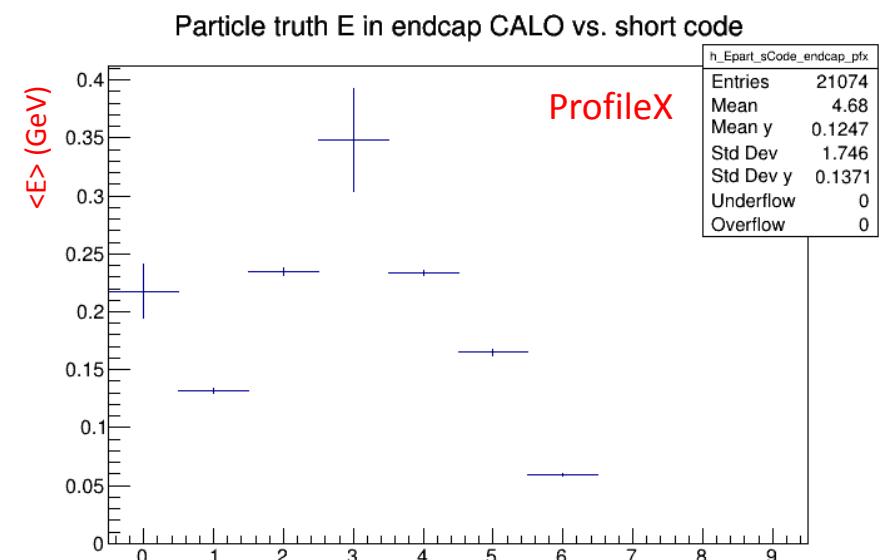

nuE vs. mode

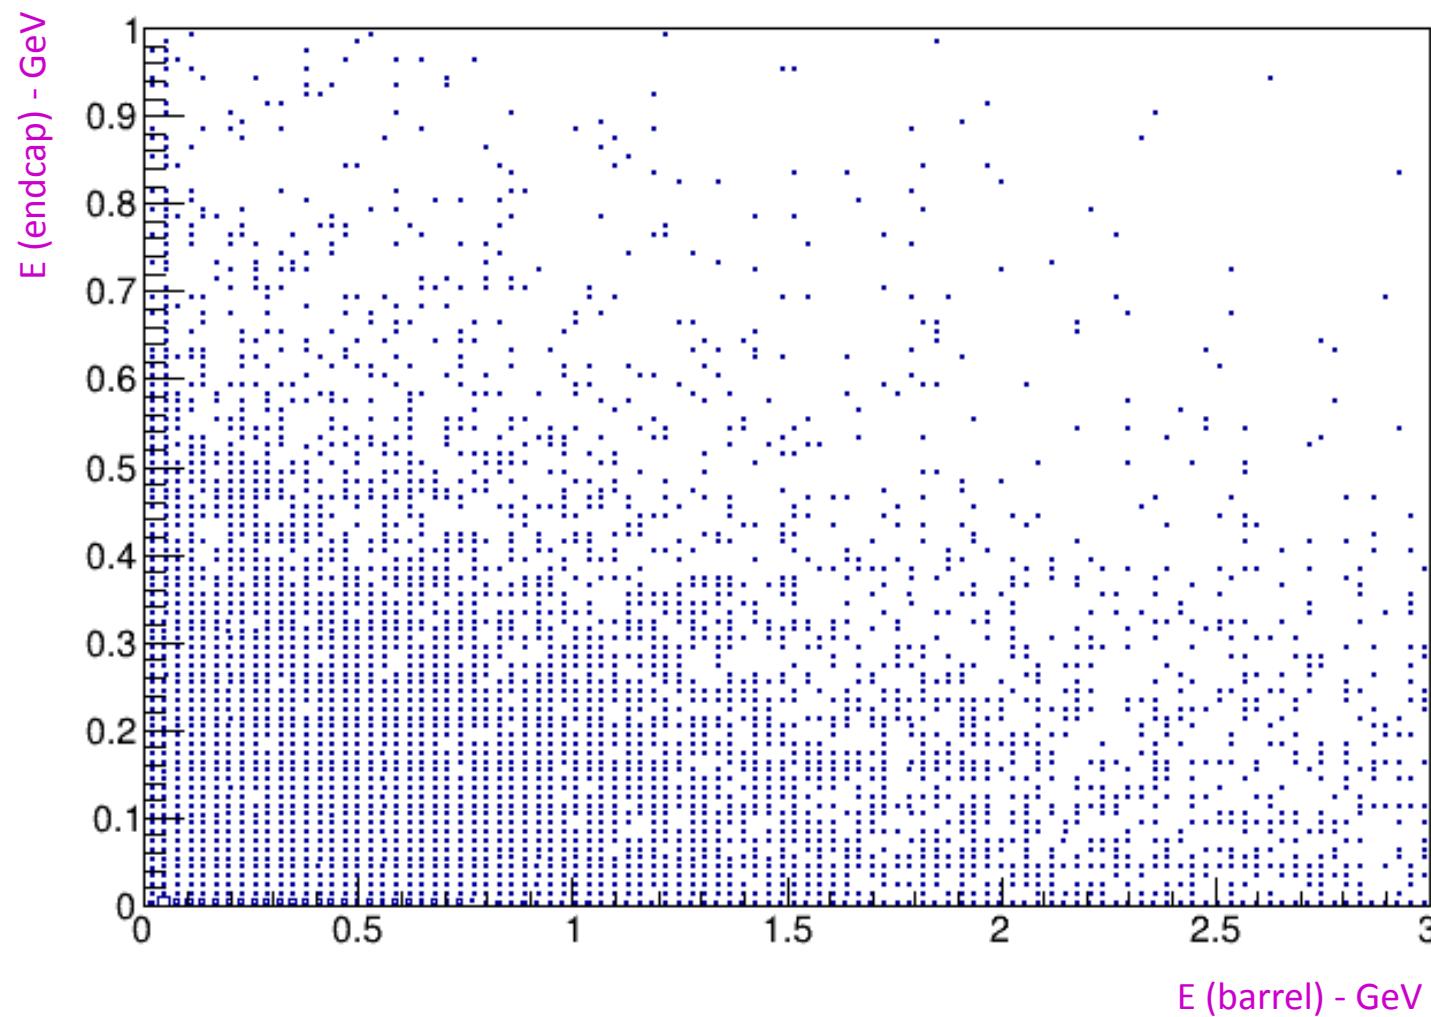

X-axis of these plots:

- 0 – electron
- 1 – muon
- 2 – charged pion
- 3 – charged kaon
- 4 – proton
- 5 – photon
- 6 – neutron

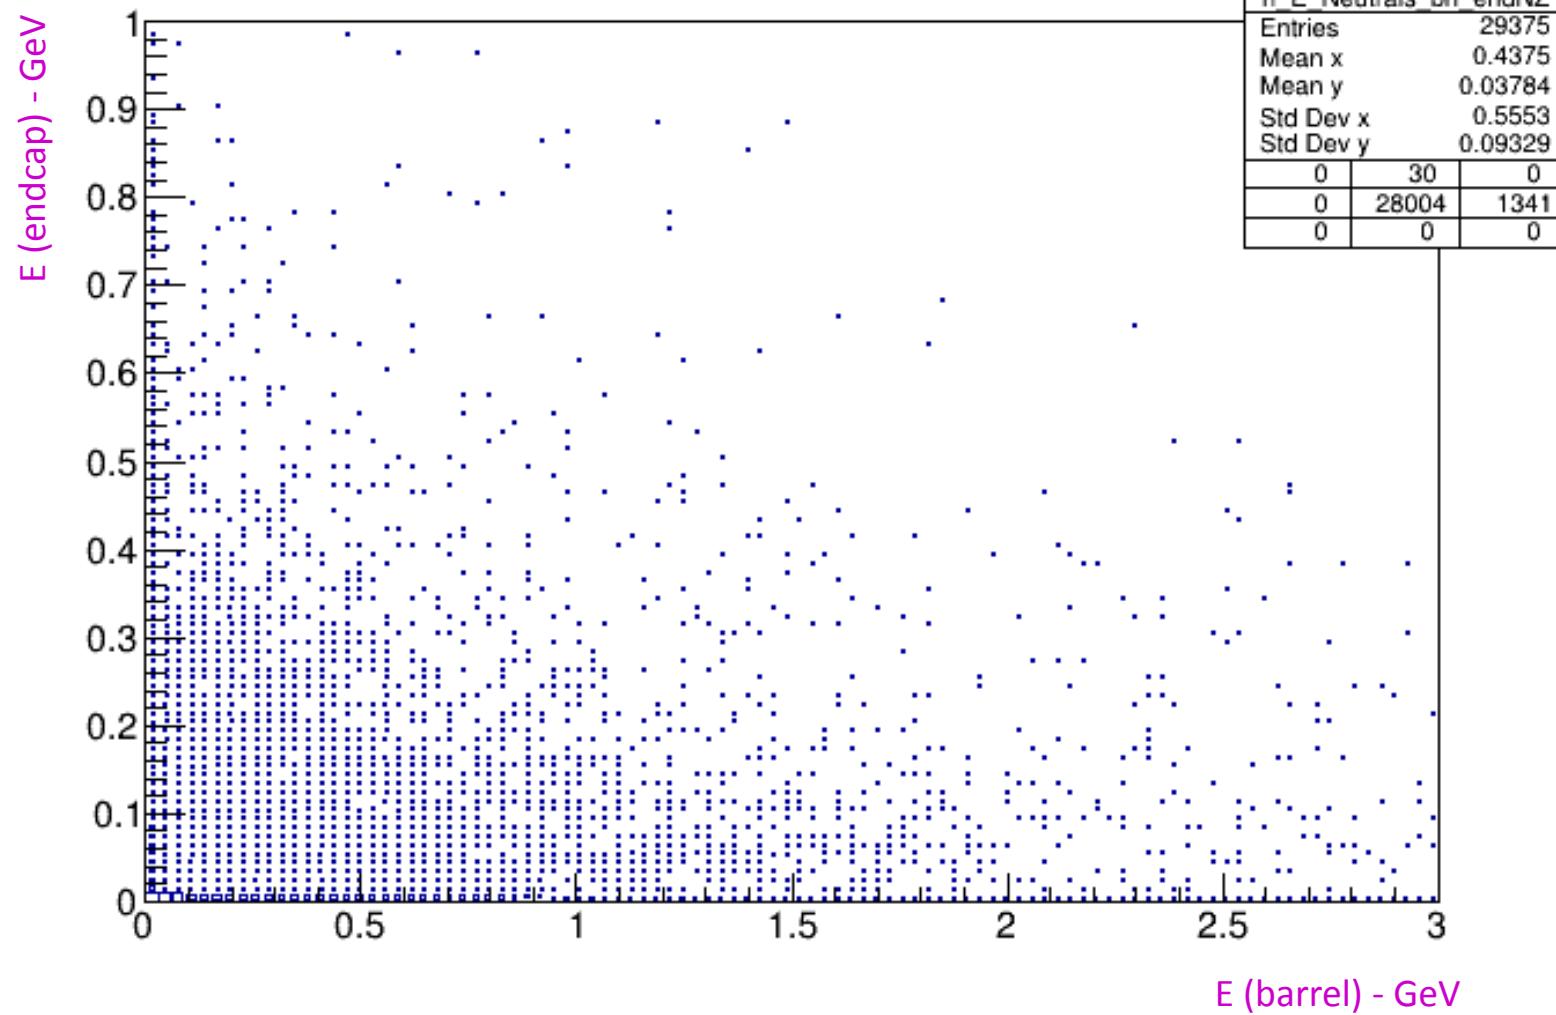

Event level plots – one entry/event - filled when Total Energy in either barrel or endcap > 0 – (97% of the events satisfy this)

Total truth E in endcap vs. barrel CALO - nonzero case

Event level plots – one entry/event – filled when Neutral Energy in either barrel or endcap > 0 – (67% of the events satisfy this)

Neutron+gamma E in endcap vs. barrel CALO - nonzero

CC ν_μ events (31772 evts)

| Mode | QE | RES | DIS | COH | MEC |
|---|------|------|-------|-----|------|
| # events | 6901 | 9487 | 13348 | 196 | 1750 |
| Fraction of events with neutral E in barrel | 0.3 | 0.7 | 0.82 | 0 | 0.64 |
| Fraction of events with neutral E in endcap | 0.13 | 0.27 | 0.26 | 0 | 0.33 |

CC anti- ν_μ events (1340)

| Mode | QE | RES | DIS | COH | MEC |
|---|------|------|------|-----|------|
| # events | 230 | 341 | 675 | 14 | 80 |
| Fraction of events with neutral E in barrel | 0.64 | 0.8 | 0.81 | 0 | 0.91 |
| Fraction of events with neutral E in endcap | 0.3 | 0.33 | 0.27 | 0 | 0.5 |

NC ν_μ events (9923 events)

| Mode | QE | RES | DIS | COH | MEC |
|---|------|------|------|------|-----|
| # events | 2176 | 3277 | 4385 | 85 | 0 |
| Fraction of events with neutral E in barrel | 0.51 | 0.81 | 0.81 | 0.84 | 0 |
| Fraction of events with neutral E in endcap | 0.19 | 0.33 | 0.27 | 0.04 | 0 |

NC anti- ν_μ events (526 events)

| Mode | QE | RES | DIS | COH | MEC |
|---|------|------|------|-----|-----|
| # events | 108 | 143 | 265 | 10 | 0 |
| Fraction of events with neutral E in barrel | 0.49 | 0.83 | 0.83 | 0.9 | 0 |
| Fraction of events with neutral E in endcap | 0.22 | 0.32 | 0.27 | 0 | 0 |
