## Triangle Quadbars

$>$ Number of events with both channels $>5$ PEs

|  | 0 | 1 | 2 | 3 |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 19593 | 9616 | 1940 | 8869 |
| 1 | 9616 | 18657 | 1206 | 1798 |
| 2 | 1940 | 1206 | 19435 | 9713 |
| 3 | 8869 | 1798 | 9713 | 19816 |

- This seems to indicate a channel order of 1-0-3-2, i.e. inner and outer channels are swapped.

- We have seen this before at CMBs for the LDMX Hcal quadbars.
- Need to verify this at the quadbar.

## PE distribution

## PEs[0][0]

## PE distribution between neighboring counters

$>$ PE distribution between neighboring triangle counters 0 and 3 for events which had no hits in counters 1 and 2

- Peaks at around +/-1 come from tiny pulses (<5 PEs) at one counter and "regular" pulses at the other counter.
