DUNE TMS meeting
July 29 2021

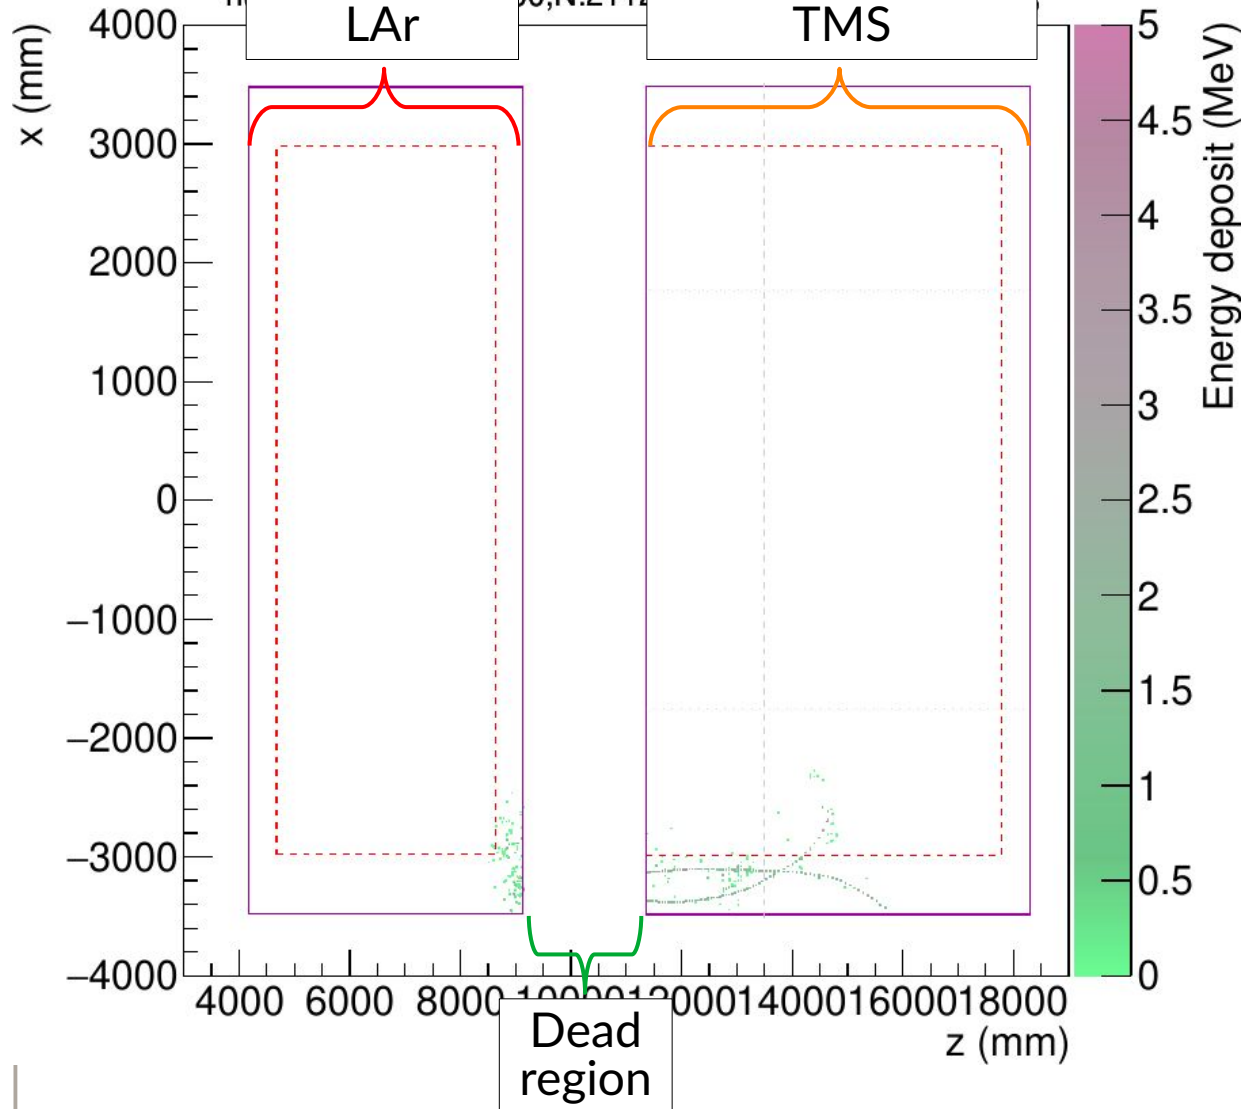

Introduction

- Event 418 in

`/pnfs/dune/persistent/users/marshalc/LArTMSProductionJun23withLArCV/
edep/FHC/00m/00/neutrino.0.edep.root`

Event 418, ν PDG: -14, $E_\nu=6.73$ GeV

`nu-14-tot-1000100400,N:2112`

Tom guessed this might be a di-muon event, where a pion has decayed in between LAr+TMS dead region

I naively thought it was a mu+pion event, perhaps coherent

Extended the true particle stack in a TMS event to include all the G4 trajectory points

Added trajectory plotting to "event display"

Introduction

Event 418, ν PDG: -14, $E_\nu = 6.73$ GeV

ν : -14, tgt: 1000180400, N: 2112, q: 2(ν), proc: Weak[CC], DIS,

nu:-14,tgt:1000180400,N:2112,q:2(ν),proc:Weak[CC],DIS,

Tom was right!

Anti-numu DIS event, where a π^- decays in the dead region, creating a opposite-sign di-muon event as seen by the TMS

My guess is it would be selected as $\mu^+\pi^-$?

But which is μ , which is π ?
I think this guess determines if classified as a numu or anti-numu interaction

This event wouldn't enter selection though, since no LAr vertex!
