

# Weekly Update 07/30/21

James Shen

# Housekeeping

- All current changes can be now found at `dunetpc/feature/jierans_SNBPointing`
- Plotting scripts/POMS config files/custom fcl generator files:  
`/dune/app/users/jierans/SN_Pointing/`
- Upgraded to Larsoft/dunetpc v09\_27\_00 to incorporate refactor changes

# Event Display

- In feature branch: `dunetpc/dune/evd/evd_dunefd_refactored`, porting most configurations from ProtoDune's event display to `dunefd`.
- Setting the correct track/hit/wirecell modules
  - Might still be missing some pandora module labels as I am not using them
- Reconfiguring the pedestals to correspond to ProtoDune's pedestal settings.

High energy: 82 MeV

# Charge-Energy correlation

- Found a bug with the BackTracker as SimChannel labelling is not set correctly, causing cheating reco checks to not work properly. Dom has fixed this.
- Generated events in the center of the TPC, see no significant improvement.
- Changed PointResTree module such that we are doing SumADC across all hits in the event.
  - Previously only summing hits tagged with the primary (longest) track, missing bremsstrahlung hits.

# Weird Bump for U/V plane

Charge vs. Energy, U plane

Charge vs. Energy, Z plane

# Misc/Next Steps

- Size of the detsim/reco stages: most of this comes from wirecell raw digits. Dom is investigating ways of trimming this back
- Investigate why daughter flipping has stopped working
  - Seems like there are less tracks to go with in general, needs confirming
- Refactoring AJ's PointResTree module
  - Code is getting cluttered from all sorts of testing
  - Keep track of more information: all tracks, number of hits, etc.
