$K \rightarrow \mu^+ \mu^-$
as a third kaon
golden mode

Avital Dery

$$K_L \rightarrow \pi^0 \nu \bar{\nu}$$

$$K^+ \rightarrow \pi^+ \nu \bar{\nu}$$

Theoretically clean, sensitive to functions of $V_{ts}^* V_{td}$, $V_{cs}^* V_{cd}$.

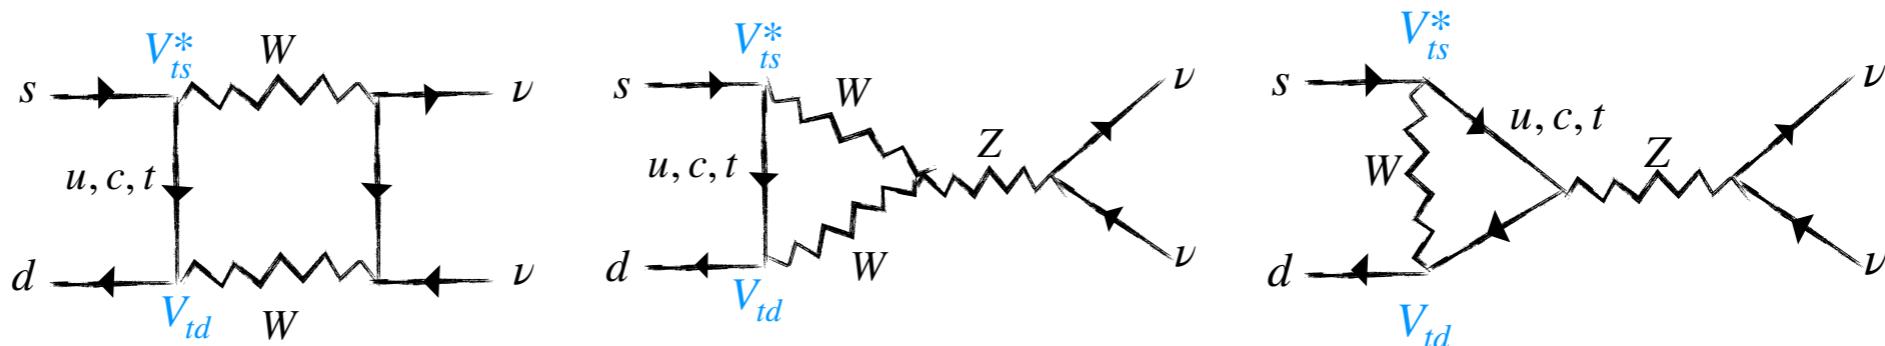

What about $K_{L,S} \rightarrow \mu^+ \mu^-$?

- 2-body vs. 3-body
- Muons vs. missing energy
- Similar weak Hamiltonian (also sensitive to $V_{ts}^* V_{td}$, $V_{cs}^* V_{cd}$)

$$\mathcal{H}_{eff} = \frac{G_F}{\sqrt{2}} \frac{\alpha}{2\pi \sin^2 \Theta_W} \sum_{l=e,\mu,\tau} \left(V_{cs}^* V_{cd} X_{NL}^l + V_{ts}^* V_{td} X(x_t) \right) (\bar{s}d)_{V-A} (\bar{\nu}_l \nu_l)_{V-A}$$

$K_L \rightarrow \pi^0 \nu \bar{\nu}$

- Within the SM determined entirely from the weak effective Hamiltonian (short-distance physics)
- Purely **CP-violating**

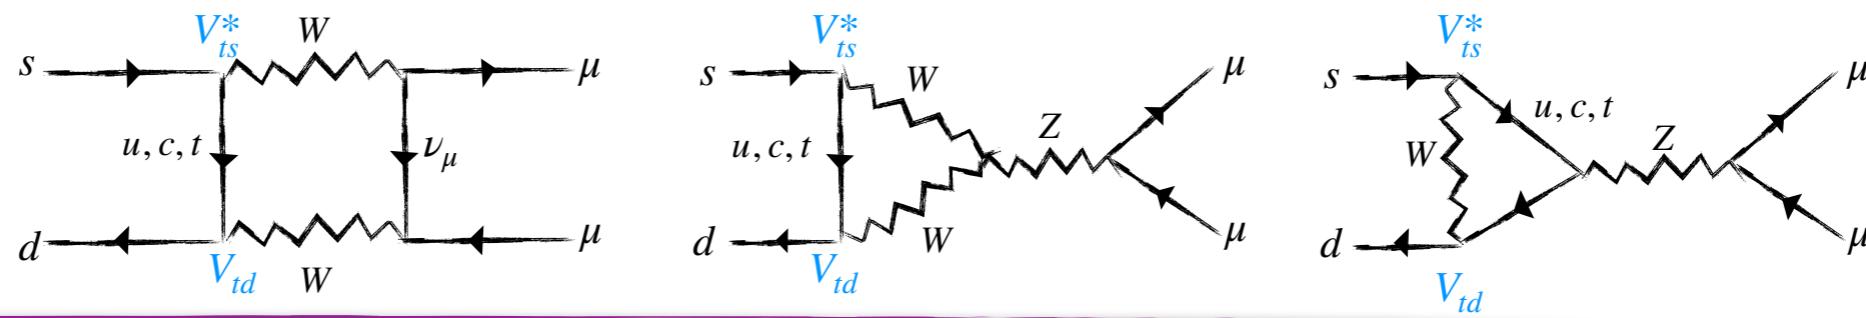

$K_{L,S} \rightarrow \mu^+ \mu^-$

- **Long-distance effects** mediate **CP conserving transitions** which dominate both for $K_L \rightarrow \mu^+ \mu^-$ and for $K_S \rightarrow \mu^+ \mu^-$

- The **short-distance contribution**, coming from the weak Hamiltonian, induces **CP violating transitions**

$$\mathcal{B}(K_L \rightarrow \mu^+ \mu^-) = (6.84 \pm 0.11) \cdot 10^{-9} \quad \mathcal{B}(K_S \rightarrow \mu^+ \mu^-) < 2.1 \cdot 10^{-10}$$

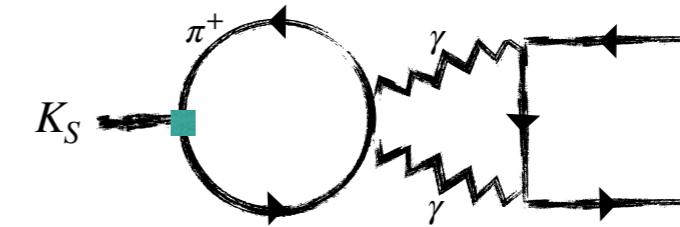

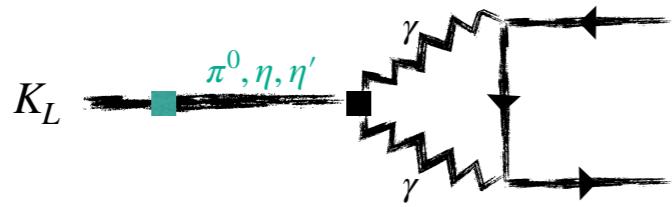

LD SD

$$\mathcal{B}(K_L \rightarrow \mu^+ \mu^-)_{\text{SM}} = \begin{cases} (6.85 \pm 0.80 \pm 0.06) \times 10^{-9} (+) \\ (8.11 \pm 1.49 \pm 0.13) \times 10^{-9} (-) \end{cases}$$

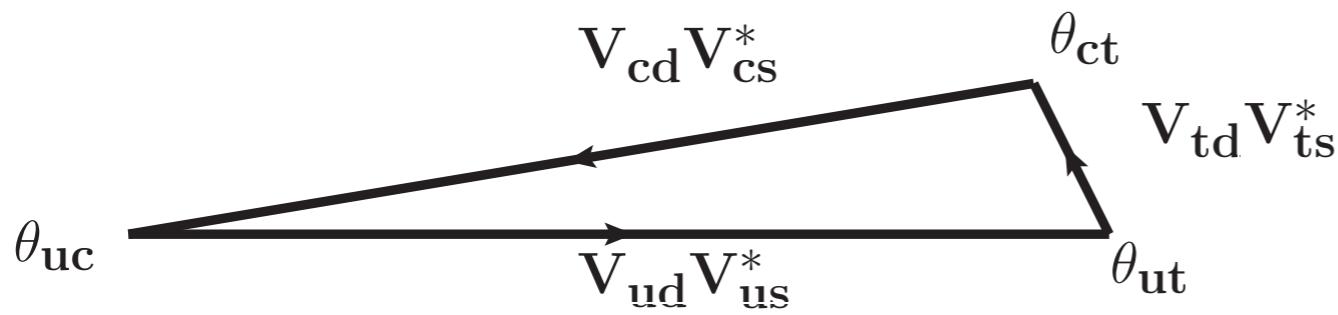

LD SD

$$\mathcal{B}(K_S \rightarrow \mu^+ \mu^-)_{\text{SM}} = (5.18 \pm 1.50 \pm 0.02) \times 10^{-12}$$

The key: CPV comes from the
weak (SD) diagrams

The key: CPV comes from the weak (SD) diagrams

$$\theta_{uc} = \arg\left(-\frac{V_{cd}V_{cs}^*}{V_{ud}V_{us}^*}\right) \sim \lambda^4$$

CP Analysis of $K \rightarrow \mu^+ \mu^-$

Initial state: kaon mass eigenstates are approximately also CP eigenstates,

$$\begin{array}{c} K_L \\ \text{CP-odd} \end{array}, \quad \begin{array}{c} K_S \\ \text{CP-even} \end{array}$$

Final state: since the kaon has $J = 0$, the dimuon state can have either $S = 0, \ell = 0$ or $S = 1, \ell = 1$ corresponding to final states:

$$\begin{array}{cc} (\bar{\mu}\mu)_{\ell=0}, & (\bar{\mu}\mu)_{\ell=1} \\ \text{CP-odd} & \text{CP-even} \end{array}$$

CP Analysis of $K \rightarrow \mu^+ \mu^-$

Initial state: kaon mass eigenstates are approximately also CP eigenstates,

$$\begin{array}{c} K_L \\ \text{CP-odd} \end{array}, \quad \begin{array}{c} K_S \\ \text{CP-even} \end{array}$$

Final state: since the kaon has $J = 0$, the dimuon state can have either $S = 0, \ell = 0$ or $S = 1, \ell = 1$

corresponding to final states:

$$\begin{array}{cc} (\bar{\mu}\mu)_{\ell=0}, & (\bar{\mu}\mu)_{\ell=1} \\ \text{CP-odd} & \text{CP-even} \end{array}$$

In practice, we measure the incoherent sums,

$$\Gamma(K_S \rightarrow \mu^+ \mu^-)_{\text{meas.}} = \Gamma(K_S \rightarrow (\mu^+ \mu^-)_{\ell=0}) + \Gamma(K_S \rightarrow (\mu^+ \mu^-)_{\ell=1})$$

$$\Gamma(K_L \rightarrow \mu^+ \mu^-)_{\text{meas.}} = \Gamma(K_L \rightarrow (\mu^+ \mu^-)_{\ell=0}) + \Gamma(K_L \rightarrow (\mu^+ \mu^-)_{\ell=1})$$

If we could extract the CPV modes, we would have a similar situation (theoretically) to $K_L \rightarrow \pi^0 \nu \bar{\nu}$

K_S - K_L Interference

G. D'Ambrosio and T. Kitahara [arXiv:1707.06999]

AD, M. Ghosh, Y. Grossman, S. Schacht [arXiv:2104.06427]

Time dependent rate:

$$\left(\frac{d\Gamma}{dt} \right) = N_f f(t), \quad f(t) = C_L e^{-\Gamma_L t} + C_S e^{-\Gamma_S t} + 2 [C_{\cos} \cos(\Delta m t) + C_{\sin} \sin(\Delta m t)] e^{-\Gamma t},$$

$$|A(K_S \rightarrow (\mu^+ \mu^-)_{\ell=1})|$$

$$|A(K_L \rightarrow (\mu^+ \mu^-)_{\ell=0})|$$

$$\text{SD } |A(K_L \rightarrow (\mu^+ \mu^-)_{\ell=1})|$$

$$\varphi_0 \equiv \arg(A(K_S)_0^* A(K_L)_0)$$

$$\varphi_1 \equiv \arg(A(K_S)_1^* A(K_L)_1)$$

A priori, 6 theory parameters

K_S - K_L Interference

G. D'Ambrosio and T. Kitahara [arXiv:1707.06999]
 AD, M. Ghosh, Y. Grossman, S. Schacht [arXiv:2104.06427]

Time dependent rate:

$$\left(\frac{d\Gamma}{dt}\right) = N_f f(t), \quad f(t) = C_L e^{-\Gamma_L t} + C_S e^{-\Gamma_S t} + 2 [C_{\cos} \cos(\Delta m t) + C_{\sin} \sin(\Delta m t)] e^{-\Gamma t},$$

4 Experimental parameters

Theory parameters: 4 amplitudes, 2 are CPC transitions and 2 are CPV,

$$\text{SD } |A(K_S \rightarrow (\mu^+ \mu^-)_{\ell=0})|$$

$$|A(K_S \rightarrow (\mu^+ \mu^-)_{\ell=1})|$$

$$|A(K_L \rightarrow (\mu^+ \mu^-)_{\ell=0})|$$

$$\text{SD } |A(K_L \rightarrow (\mu^+ \mu^-)_{\ell=1})|$$

$$\varphi_0 \equiv \arg(A(K_S)_0^* A(K_L)_0)$$

~~$$\varphi_1 \equiv \arg(A(K_S)_1^* A(K_L)_1)$$~~

The SM weak leptonic current, $(\bar{\mu}_L \gamma^\mu \mu_L)$, creates only the CP-odd $(\bar{\mu}\mu)_{\ell=0}$ state

(corrections at $\mathcal{O}(m_K^2/m_W^2)$)

A priori, ~~✓~~ theory parameters

4, 1 of which is pure SD

SM prediction

G. D'Ambrosio and T. Kitahara [arXiv:1707.06999]

AD, M. Ghosh, Y. Grossman, S. Schacht [arXiv:2104.06427]

Only hadronic parameter, $\mathcal{O}(1\%)$
uncertainty from isospin breaking

$$|A(K_S)_0|^2 = \left| \frac{G_F}{2} \frac{2\alpha_{em} m_K m_\mu Y(x_t)}{\pi \sin^2 \theta_W} \times f_K \times V_{cs} V_{cd} \text{Im} \left(\frac{V_{ts}^* V_{td}}{V_{cs}^* V_{cd}} \right) \right|^2$$

$$\bar{\eta}_{ds} = A^2 \lambda^4 \bar{\eta} + \mathcal{O}(\lambda^7)$$

K_S - K_L Interference

G. D'Ambrosio and T. Kitahara [arXiv:1707.06999]
AD, M. Ghosh, Y. Grossman, S. Schacht [arXiv:2104.06427]

Time dependent rate:

$$\left(\frac{d\Gamma}{dt} \right) = N_f f(t), \quad f(t) = C_L e^{-\Gamma_L t} + C_S e^{-\Gamma_S t} + 2 [C_{\cos} \cos(\Delta m t) + C_{\sin} \sin(\Delta m t)] e^{-\Gamma t},$$

$$C_L = |A(K_L)_0|^2$$

$$C_S = |A(K_S)_0|^2 + \beta_\mu^2 |A(K_S)_1|^2$$

$$C_{\cos} = D |A(K_S)_0 A(K_L)_0| \cos(\varphi_0)$$

$$C_{\sin} = D |A(K_S)_0 A(K_L)_0| \sin(\varphi_0)$$

$$D = \frac{N_{K^0} - N_{\bar{K}^0}}{N_{K^0} + N_{\bar{K}^0}}$$

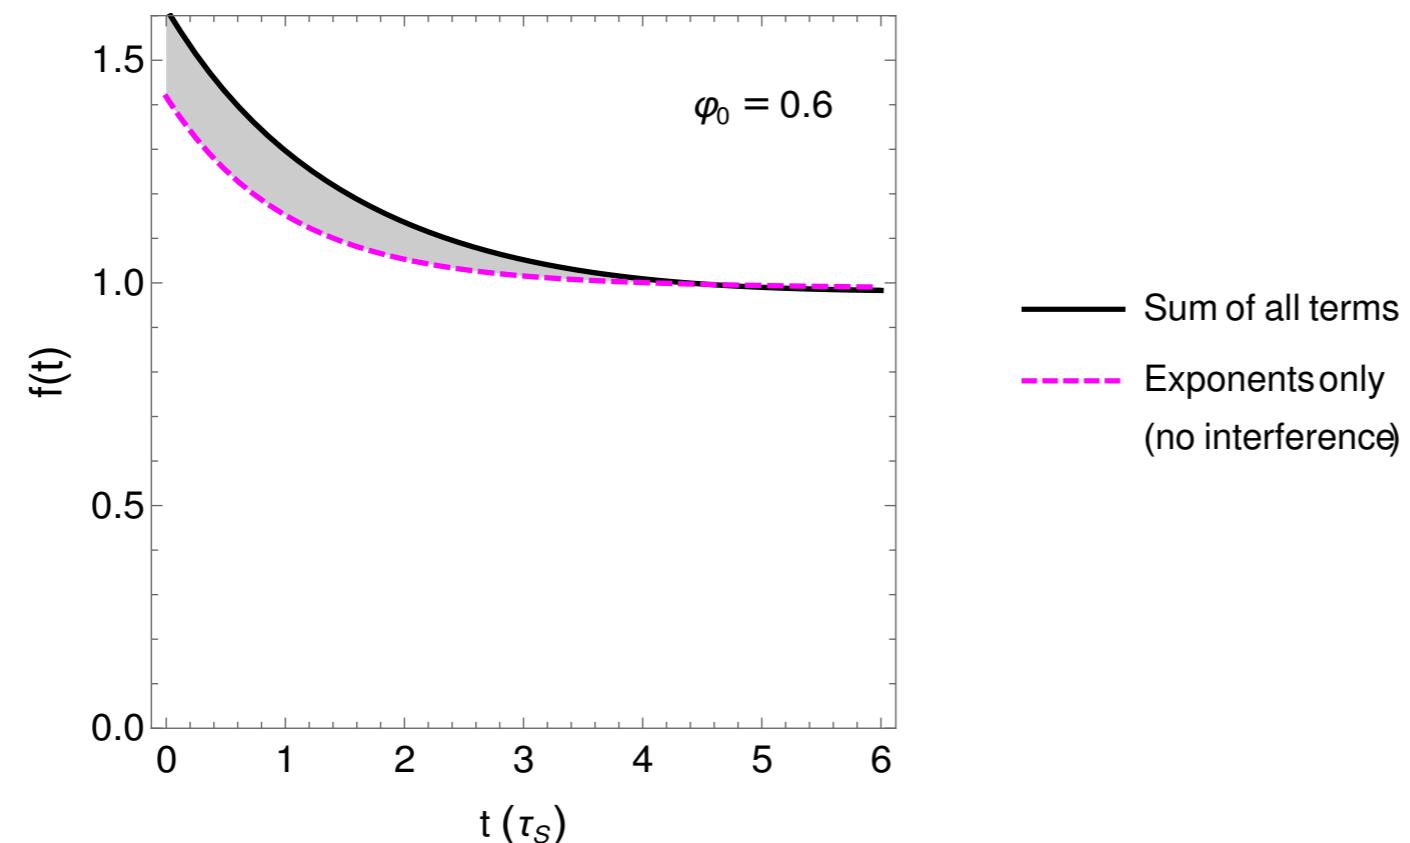

$$\frac{1}{D^2} \frac{C_{\sin}^2 + C_{\cos}^2}{C_L} = |A(K_S)_0|^2$$

K_S - K_L Interference

G. D'Ambrosio and T. Kitahara [arXiv:1707.06999]
AD, M. Ghosh, Y. Grossman, S. Schacht [arXiv:2104.06427]

Time dependent rate:

$$\left(\frac{d\Gamma}{dt} \right) = N_f f(t), \quad f(t) = C_L e^{-\Gamma_L t} + C_S e^{-\Gamma_S t} + 2 [C_{\cos} \cos(\Delta m t) + C_{\sin} \sin(\Delta m t)] e^{-\Gamma t},$$

Approximate SM prediction,
 $D = 1$:

$$(C_L)_{\text{SM}} \equiv 1$$

$$(C_S)_{\text{SM}} \approx 0.43$$

$$(C_{\text{Int.}})_{\text{SM}} = \sqrt{C_{\cos}^2 + C_{\sin}^2} \approx 0.12$$

SM prediction

G. D'Ambrosio and T. Kitahara [arXiv:1707.06999]

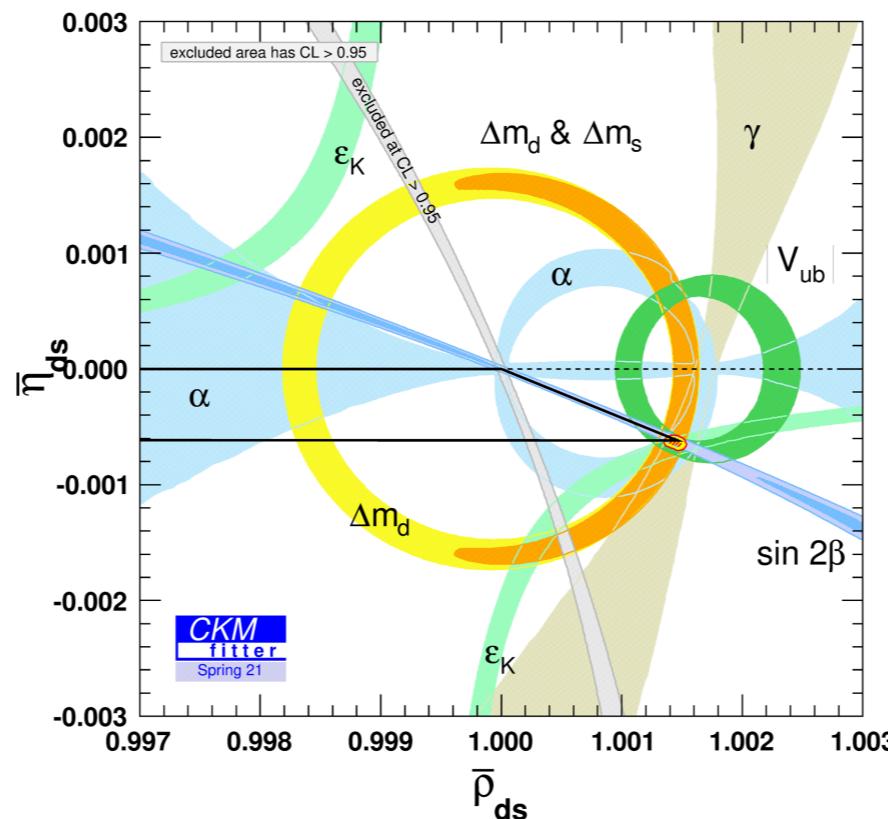

AD, M. Ghosh, Y. Grossman, S. Schacht [arXiv:2104.06427]

Only hadronic parameter, $\mathcal{O}(1\%)$
uncertainty from isospin breaking

$$|A(K_S)_0|^2 = \left| \frac{G_F}{2} \frac{2\alpha_{em} m_K m_\mu Y(x_t)}{\pi \sin^2 \theta_W} \times f_K \times V_{cs} V_{cd} \text{Im} \left(\frac{V_{ts}^* V_{td}}{V_{cs}^* V_{cd}} \right) \right|^2$$

$$\bar{\eta}_{ds} = A^2 \lambda^4 \bar{\eta} + \mathcal{O}(\lambda^7)$$

Current error on $\bar{\eta}_{ds}$
from B physics is $\mathcal{O}(5\%)$

SM prediction

G. D'Ambrosio and T. Kitahara [arXiv:1707.06999]

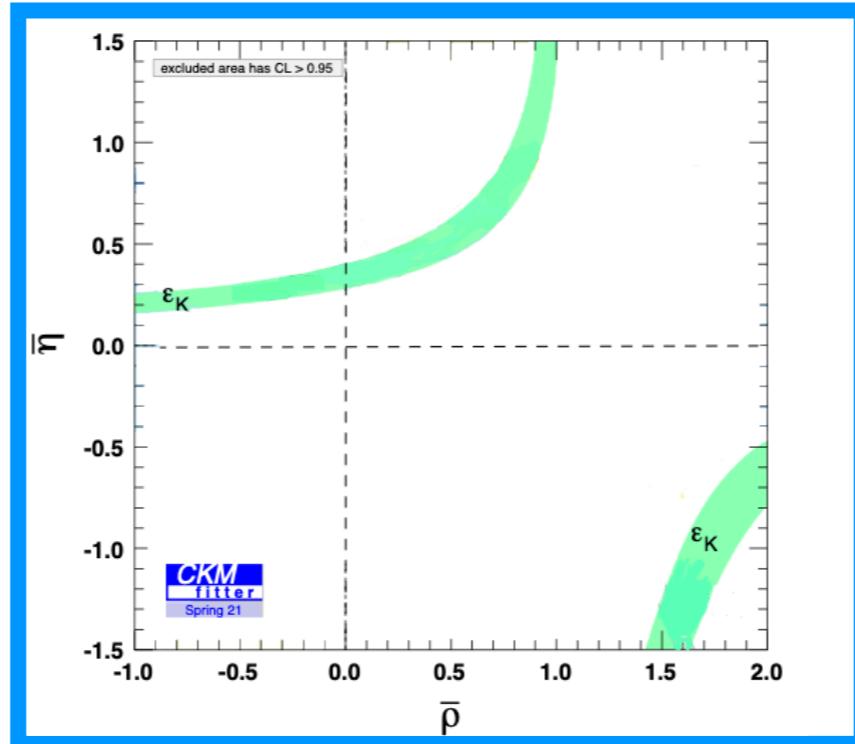

AD, M. Ghosh, Y. Grossman, S. Schacht [arXiv:2104.06427]

Only hadronic parameter, $\mathcal{O}(1\%)$
uncertainty from isospin breaking

$$|A(K_S)_0|^2 = \left| \frac{G_F}{2} \frac{2\alpha_{em} m_K m_\mu Y(x_t)}{\pi \sin^2 \theta_W} \times f_K \times V_{cs} V_{cd} \text{Im} \left(\frac{V_{ts}^* V_{td}}{V_{cs}^* V_{cd}} \right) \right|^2$$

$$\bar{\eta}_{ds} = A^2 \lambda^4 \bar{\eta} + \mathcal{O}(\lambda^7)$$

Current picture from
kaon physics:

SM prediction

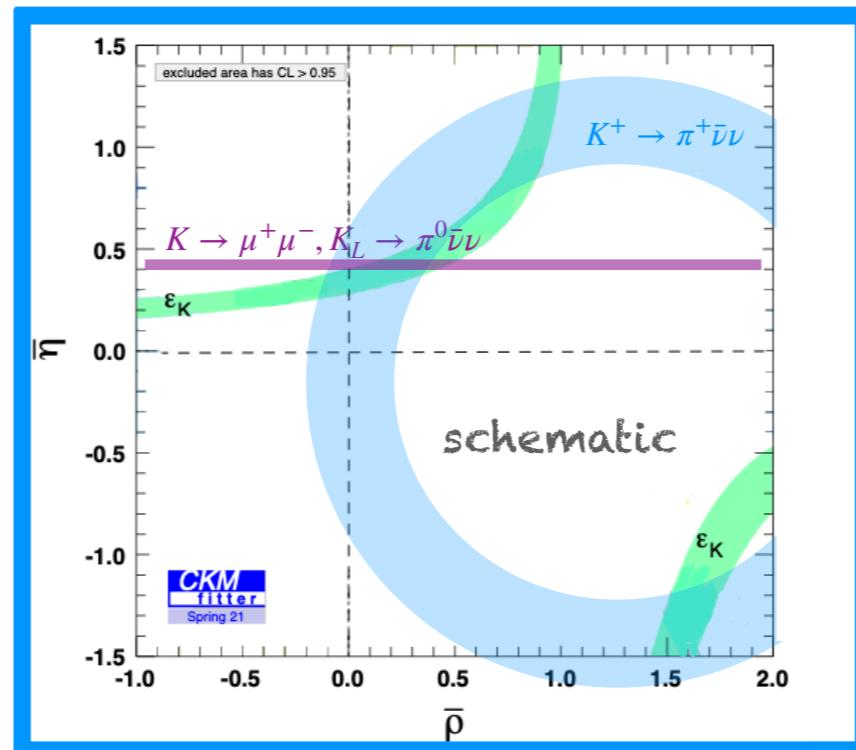

G. D'Ambrosio and T. Kitahara [arXiv:1707.06999]

AD, M. Ghosh, Y. Grossman, S. Schacht [arXiv:2104.06427]

Only hadronic parameter, $\mathcal{O}(1\%)$
uncertainty from isospin breaking

$$|A(K_S)_0|^2 = \left| \frac{G_F}{2} \frac{2\alpha_{em} m_K m_\mu Y(x_t)}{\pi \sin^2 \theta_W} \times f_K \times V_{cs} V_{cd} \text{Im} \left(\frac{V_{ts}^* V_{td}}{V_{cs}^* V_{cd}} \right) \right|^2$$

Future picture from
kaon physics:

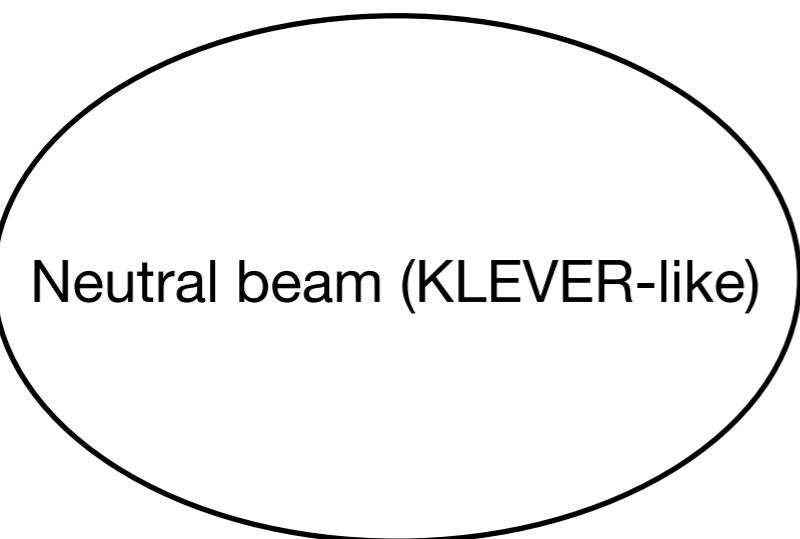

$$\bar{\eta}_{ds} = A^2 \lambda^4 \bar{\eta} + \mathcal{O}(\lambda^7)$$

Time dependence in $K \rightarrow \mu^+ \mu^-$ would make it a *golden mode*, cleanly sensitive to $\bar{\eta}_{ds} \approx A^2 \lambda^4 \bar{\eta}$

The key is in K_S - K_L interference

Experimental feasibility

Pilot study

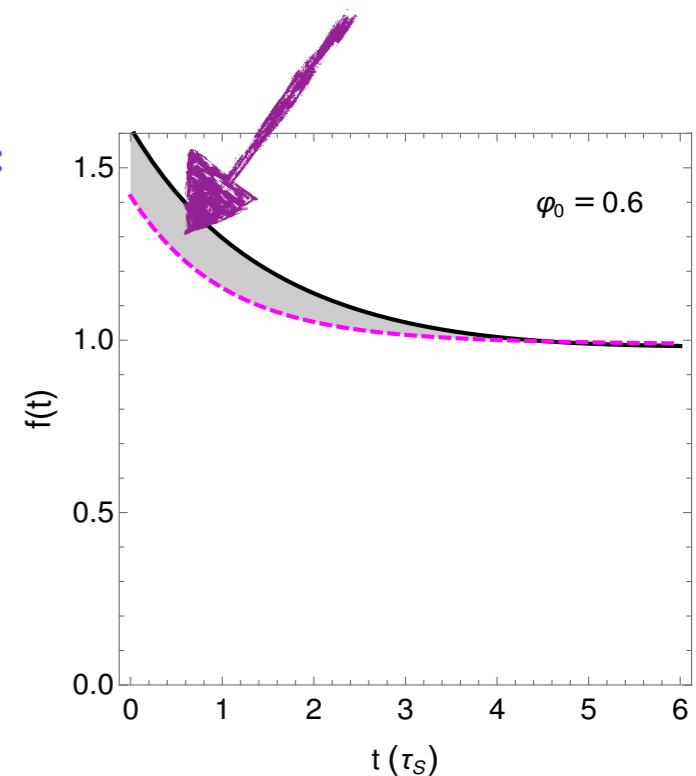

Signal yield for 10^{19} POT/year

Courtesy of Rado Marchevski

- Yield for interference events can't reliably be computed
 - ★ Depends heavily on the beam setup (incident angle + collimation) and the strong phase
 - ★ Expected number of interference decays in $0 - 6\tau_s \sim 500 - 2000$ events/year (no selection)
 - ★ Signal efficiency $\sim 15\% \rightarrow 75 - 300$ events/year (after full selection)
 - ★ Optimization of the beam line essential to determine if the sensitivity is sufficient

- The fiducial volume of the experiment is larger than the first $6\tau_s$ ($FV \sim 60m$)
- Large number of K_S , K_L and Λ decays in the 60m FV (setup from previous slide):

- ★ $K_L \sim 4 \times 10^{13}$ decays/year
- ★ $K_S \sim 3 \times 10^{13}$ decays/year
- ★ $\Lambda \sim 1 \times 10^{13}$ decays/year

Experimental feasibility

Pilot study

Courtesy of Rado Marchevski

■ Main experimental challenges

- ★ Unprecedented amount of statistics is needed for a few % measurement:
 $O(10^{15})$ neutral kaon decays
- ★ Incredibly high event rates in the detectors: next generation detector technology is needed
- ★ Very intensive mixed neutral beam line (short + long beam): radiation protection issues
- The experiment will be a great challenge but it might be possible in the near future

Experimental feasibility

- * – acceptances assumed the same as in NA48/1
- ** – same safety factor 3 (previous slide)
- *** – m_{ee}>0.165 GeV/c² phase space used
- **** – Assume factor 2 lower than K_s due to additionally suppressing the Greenley BG

Summary and Conclusions

- ◆ The time-dependent rate in $K \rightarrow \mu^+ \mu^-$ is an additional *golden mode*, allowing for a clean independent determination of CKM parameters from kaon physics.
- ◆ The theoretical uncertainty is of at most $\mathcal{O}(1\%)$
- ◆ The relevant CKM parameter is $\bar{\eta}_{ds} \approx A^2 \lambda^4 \bar{\eta}$, the same as for $K_L \rightarrow \pi^0 \bar{\nu}\nu$.
- ◆ The ratio $\mathcal{B}(K_S \rightarrow \mu^+ \mu^-)_{\ell=0} / \mathcal{B}(K_L \rightarrow \pi^0 \bar{\nu}\nu)$ is an extremely clean SM observable, dependent only on the parameters λ, m_t .

$$R_{\text{SL}} = \frac{\mathcal{B}(K_S \rightarrow \mu^+ \mu^-)_{\text{SD}}}{\mathcal{B}(K_L \rightarrow \pi^0 \bar{\nu}\nu)} = 1.55 \times 10^{-2} \left[\frac{\lambda}{0.225} \right]^2 \left[\frac{Y(x_t)}{X(x_t)} \right]^2$$

A. J. Buras and E. Venturini,
[arXiv:2109.11032]

Summary and Conclusions

- ◆ The same $K \rightarrow \mu^+ \mu^-$ observable is also a sensitive probe of NP [AD, M. Ghosh
[arXiv:2112.05801]]
- ◆ The experimental requirements are very challenging and require more investigation, but no show stopper for a future machine.
- ◆ Such a machine would additionally be sensitive to many kaon and hyperon decay modes - Exciting opportunity to understand what interesting physics can be done with these unprecedented yields

Eliminating $|V_{cb}|$ - related uncertainty

A. J. Buras and E. Venturini
[arXiv:2109.11032]

Use four basic CKM parameters:

$$\lambda = |V_{us}|, \quad |V_{cb}|, \quad \beta, \quad \gamma$$

Tension between inclusive and exclusive determinations of $|V_{cb}|$:

$$|V_{cb}|_{B \rightarrow X_c} = (42.16 \pm 0.50) \cdot 10^{-3}$$
$$|V_{cb}|_{B \rightarrow D^{(*)}\ell\nu} = (39.36 \pm 0.68) \cdot 10^{-3}$$

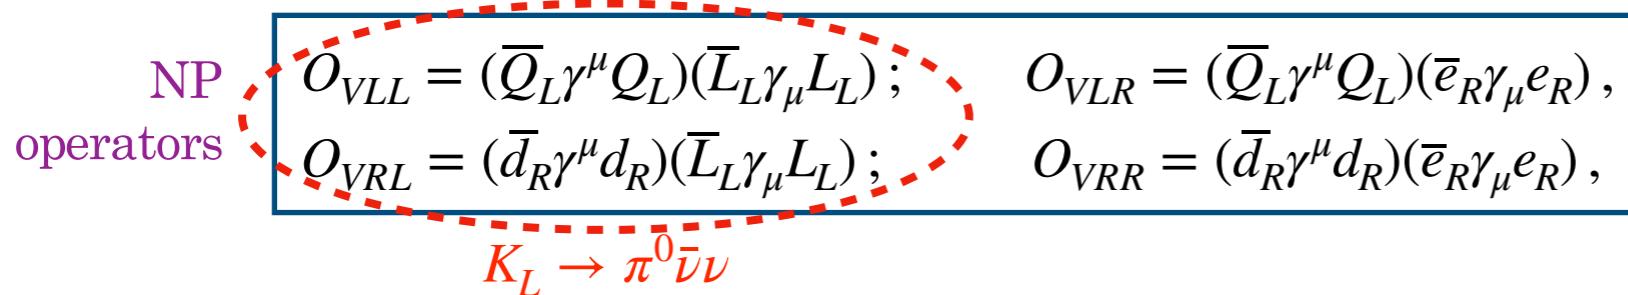

$$R_{\text{SL}} = \frac{\mathcal{B}(K_S \rightarrow \mu^+ \mu^-)_{\text{SD}}}{\mathcal{B}(K_L \rightarrow \pi^0 \nu \bar{\nu})} = 1.55 \times 10^{-2} \left[\frac{\lambda}{0.225} \right]^2 \left[\frac{Y(x_t)}{X(x_t)} \right]^2$$

Independent of any SM parameters other than λ, m_t .

$K \rightarrow \mu^+ \mu^-$ beyond the SM

[AD, M. Ghosh, JHEP 03 (2022) 048, [arXiv:2112.05801]]

$$R(K_S \rightarrow \mu^+ \mu^-)_{\ell=0} \equiv \frac{\mathcal{B}(K_S \rightarrow \mu^+ \mu^-)_{\ell=0}}{\mathcal{B}(K_S \rightarrow \mu^+ \mu^-)_{\ell=0}^{\text{SM}}} \lesssim \underline{1280} \text{ [LHCb]}$$

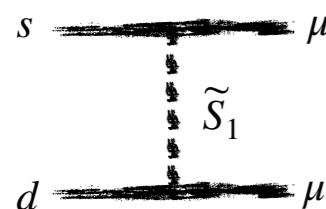

$$O_{SLR} = (\bar{Q}_L d_R)(\bar{e}_R L_L),$$

$$O_{SRL} = (\bar{d}_R Q_L)(\bar{L}_L e_R).$$

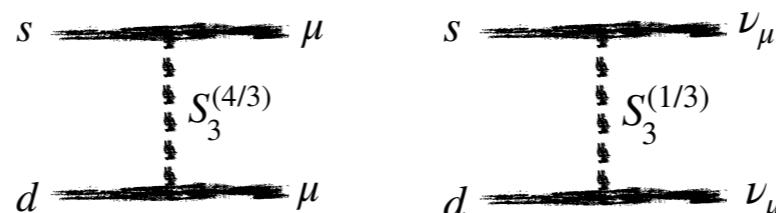

Example models:

A. Scalar Leptoquark $\tilde{S}_1 \sim (\bar{3}, 1)_{4/3}$

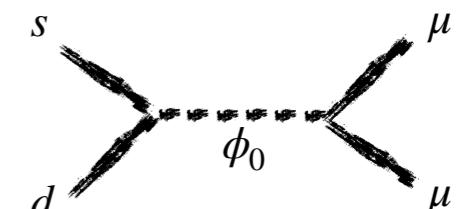

Can saturate the current bound while satisfying all existing constraints

B. Scalar Leptoquark $S_3 \sim (\bar{3}, 3)_{1/3}$

$R(K_S \rightarrow \mu^+ \mu^-)_{\ell=0} \lesssim 26$, bounded by the GN bound on $R(K_L \rightarrow \pi^0 \bar{\nu}\nu)$

C. 2HDM $\Phi \sim (1, 2)_{1/2} = \begin{pmatrix} \phi^+ \\ \phi_0 \end{pmatrix}$

Can saturate the current bound while satisfying all existing constraints

$$K_L \rightarrow \pi^0 \nu \bar{\nu}$$

$$[K_L]_{\text{CP-odd}} \rightarrow [\pi^0 \nu \bar{\nu}]_{\text{CP-even}}$$

CP violating transition

- Within the SM determined entirely from the weak effective Hamiltonian (**short-distance physics**)
- The leptonic current, $(\bar{\nu}_L \gamma^\mu \nu_L)$, creates a CP-odd $(\bar{\nu} \nu)$ state

$$K_{L,S} \rightarrow \mu^+ \mu^-$$

$$[K_S]_{\text{CP-even}} \rightarrow [\mu^+ \mu^-]_{\text{CP-odd}}$$

$$[K_S]_{\text{CP-even}} \rightarrow [\mu^+ \mu^-]_{\text{CP-even}}$$

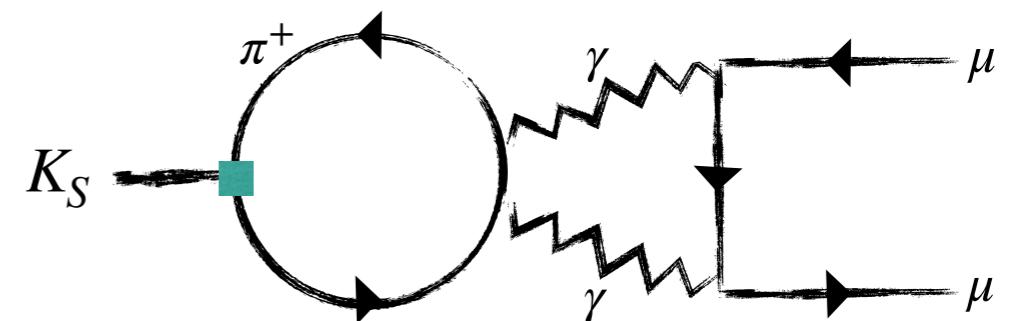

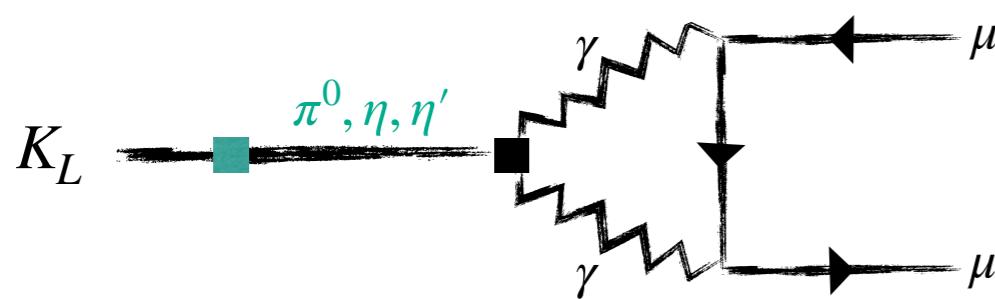

$$[K_L]_{\text{CP-odd}} \rightarrow [\mu^+ \mu^-]_{\text{CP-odd}}$$

$$[K_L]_{\text{CP-odd}} \rightarrow [\mu^+ \mu^-]_{\text{CP-even}}$$

- **Long-distance effects** mediate **CP conserving transitions** which dominate both for $K_L \rightarrow \mu^+ \mu^-$ and for $K_S \rightarrow \mu^+ \mu^-$
- The **short-distance contribution**, coming from the weak Hamiltonian, induces **CP violating transitions**

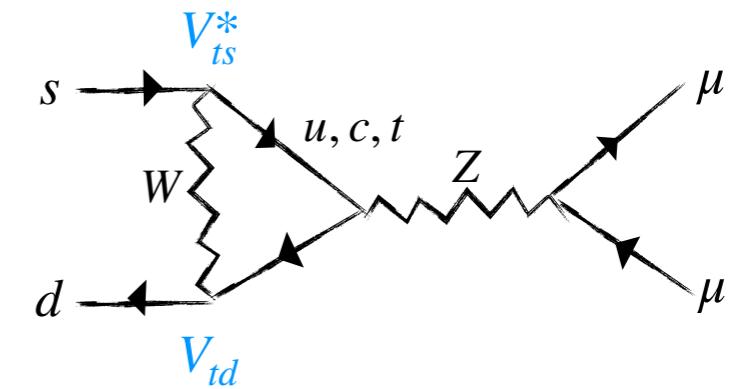

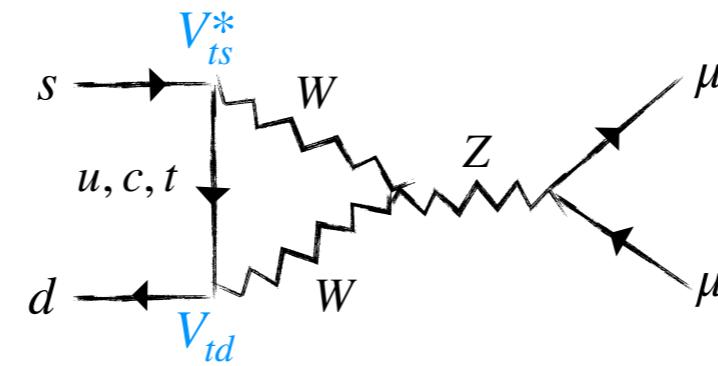

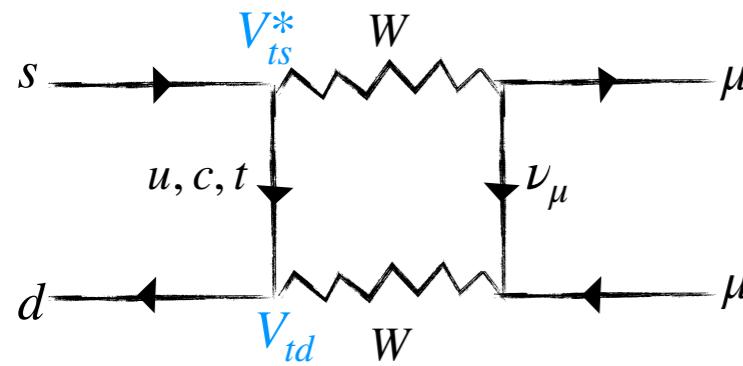

$$K \rightarrow \mu^+ \mu^-$$

Long-distance (LD) contributions
