Search GitLab

- `user_limit_single.lint`: defines an example lower bound limit.
- `user_limit_double.lint`: defines an example double-sided limit.
- `user_limit_rvalue.lint`: defines an example full limit using `r`-values.
- `user_limit_prod`: defines the production mechanisms for the limit.

5. `logo.py`: draws the Darkcast logo.

The following is a simple usage example which recasts the prompt LHCb dark photon limits to the B boson model.

```
# Load the module.
import darkcast

# Change any global parameters, here the speed of light (m/s).
darkcast.pars.c = 3e8

# Load a limit, here the LHCb prompt limit.
limit = darkcast.Limit('LHCb_Aai2017/ft_prompt')

# Print the notes and BibTex for the limit.
print limit.notes
print limit.bibtex

# Load a model for recasting.
model = darkcast.Model('B_boson')

# Recast from the limit model to the new model.
recast = limit.recast(model)

# Write out the recast limit.
recast.write('LHCb_B_boson.lint')
```

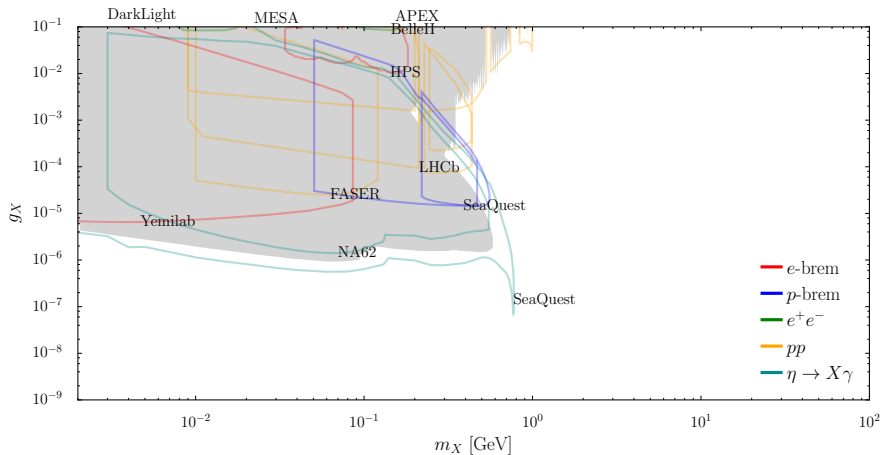

References

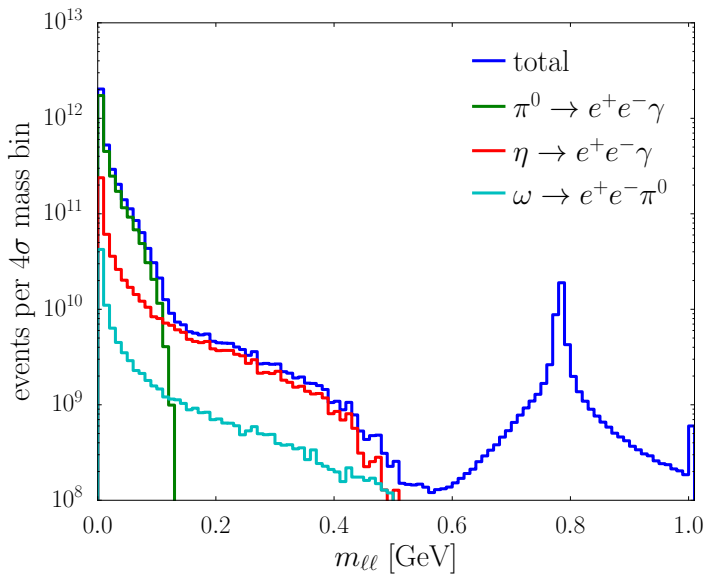

When using Darkcast, please cite [Serpignin in dark photon searches](#) as published in JHEP. Individual citations are also provided for each limit via `Limit.Bibtex` and a comprehensive list of references is provided in the `ref` directory.

Run 3 Projection - Rough Numbers

- these are very rough numbers, but include all detector efficiencies
- roughly 4 η per event and 0.5 η' per event

decay	number of candidates
$\eta \rightarrow \gamma \mu^+ \mu^-$	3×10^8
$\eta \rightarrow \mu^+ \mu^-$	6×10^6
$\eta \rightarrow \mu^+ \mu^- \pi^+ \pi^-$	1×10^4
$\eta' \rightarrow \mu^+ \mu^-$	2×10^4
$\eta' \rightarrow \mu^+ \mu^- \pi^+ \pi^-$	1×10^4
$\eta \rightarrow \gamma \ ^3S_1[\text{TM}](\rightarrow e^+ e^-)$	6×10^2
