

MAGIS-100 bakeout control system prototype test

Sergei Nagaitsev, Evan Angelico (now at Stanford),
Henry Hunt, Cici Hanna (U.Chicago)

Ron Kellett, Lucy Nobrega (Fermilab)

Nov 23, 2021

Introduction: the WiDAQ project at UChicago

Wi-DAQ project is funded by 2019 UChicago College Innovation Grant S. Nagaitsev (PI) and by 2021 UChicago EFI summer research grant

Some definitions

- IOC – input/output controller
- IoT – Internet of Things
- MQTT (Message Queuing Telemetry Transport) is an open OASIS and ISO standard (ISO/IEC 20922) lightweight, publish-subscribe network protocol that transports messages between devices. The protocol usually runs over TCP/IP;
- Node.js is an open-source, cross-platform, back-end JavaScript runtime environment that runs on the Chrome V8 engine and executes JavaScript code outside a web browser.
- Node-RED is a flow-based development tool for visual programming developed originally by IBM for wiring together hardware devices, APIs and online services as part of the Internet of Things.

MAGIS bakeout concept

- This is a Fermilab-specific use case of Wi-DAQ.
 - The existing ACNET accelerator controls system (user interface with data logging, alarms, plotting, etc)
 - ACNET uses the so-called “controls network”, behind the Fermilab Firewall. The Controls network presently does not allow wifi devices.
 - We are proposing to use “wired” RPi’s on the Fermilab controls network with static IP addresses.
 - May need ~40 Raspberry Pi’s equally spaced along the 100-m vacuum pipe
 - Each RPi can read 16 type-T thermocouples and post it using an FTP service

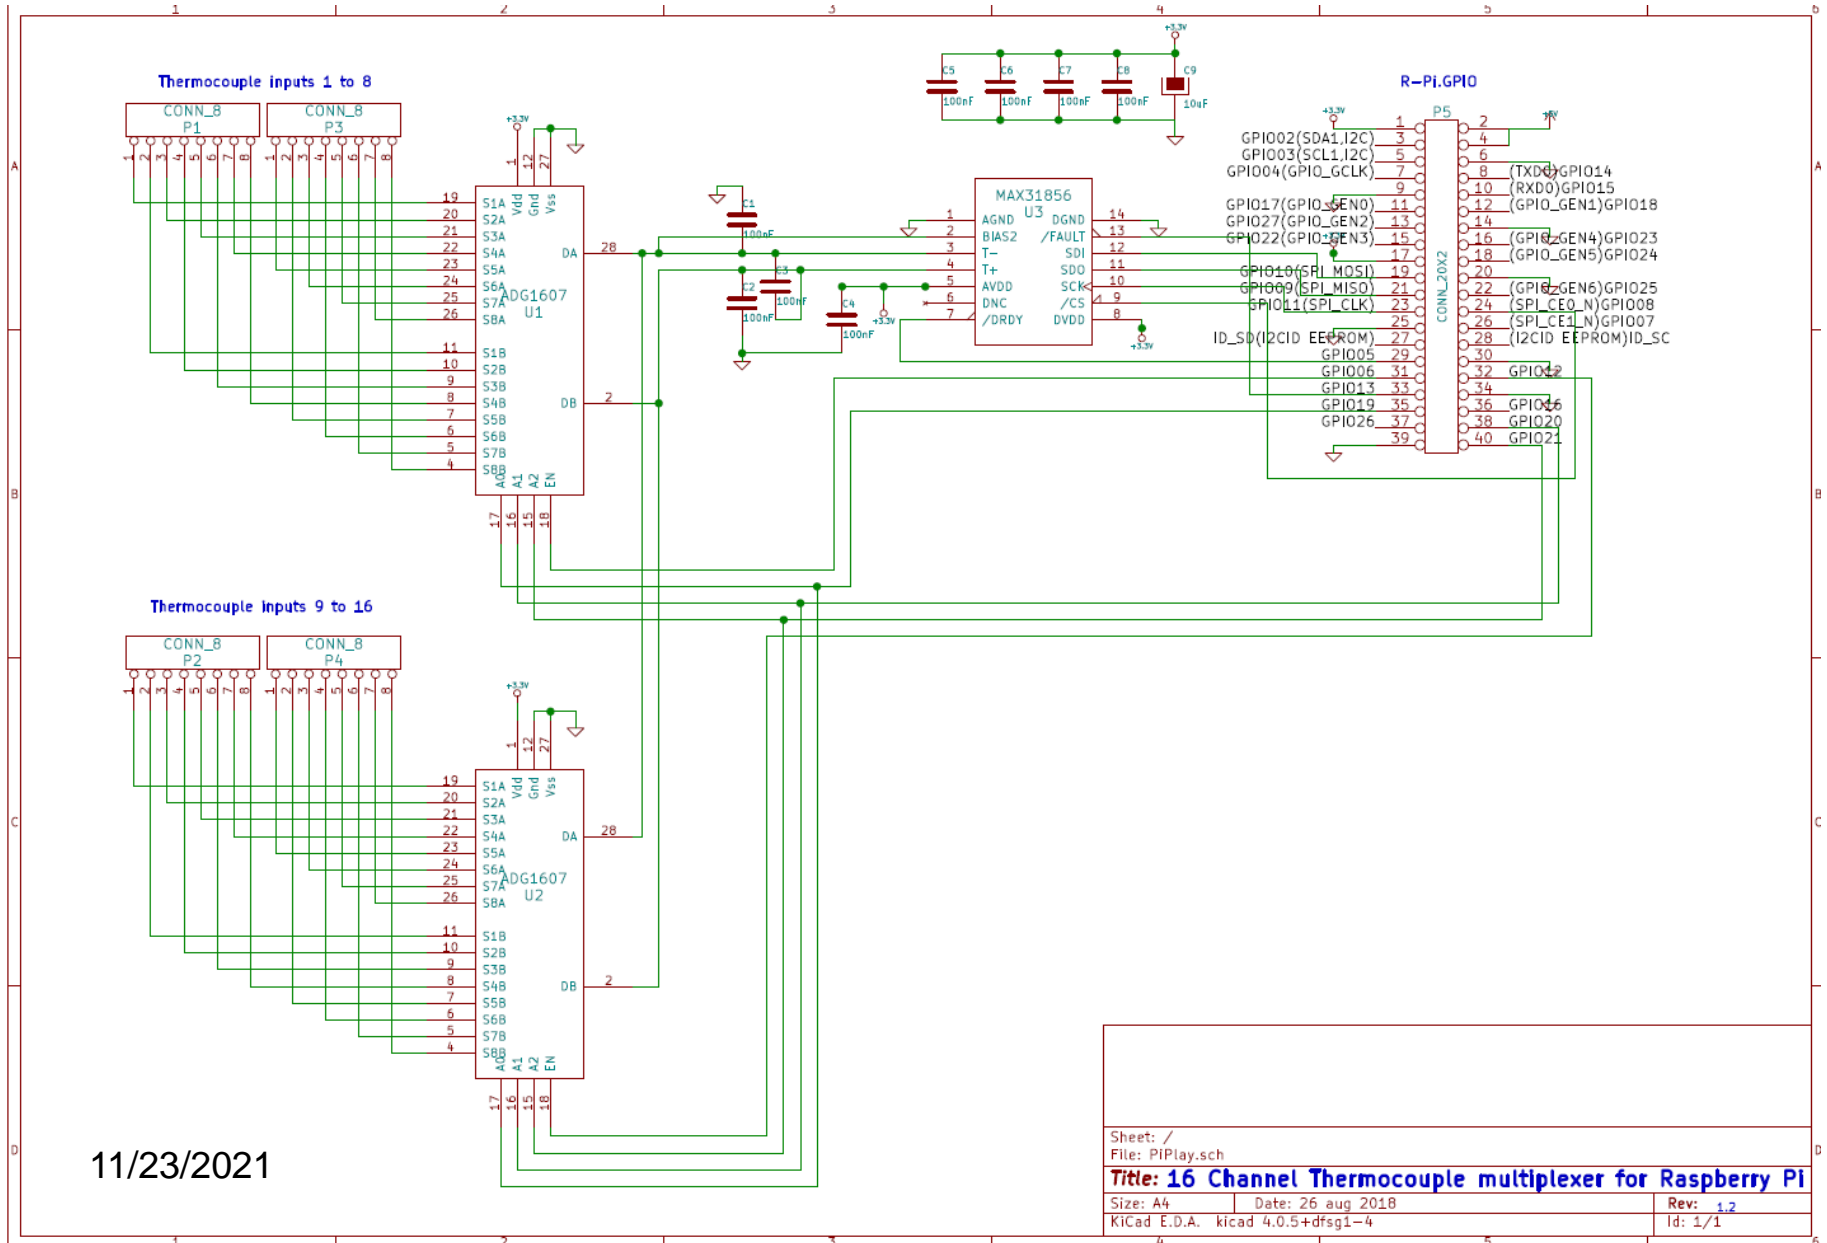

Diagram of shaft and surface boards

Proposed hardware

- Temperature module (shaft):
 - Raspberry Pi 3B+ (or 4B)
 - 16-channel multiplexer board via an SPI interface
 - 16 T-type TC's
- Heater power controls module (upstairs)
 - RPi 3B+
 - Teensy 4.0 with a 5Hz PWM capability
 - 10-A SSR
 - ...

16-channel TC board

11/23/2021

Sheet: /		File: PIPlay.sch	
Title: 16 Channel Thermocouple multiplexer for Raspberry Pi			
Size: A4	Date: 26 aug 2018	Rev: 1.2	
KiCad E.D.A. kicad 4.0.5+dfsg1-4		Id: 1/1	

16-channel multiplexer

- 3 devices have been procured
- 2 are operational (one at UChicago and one at Fermilab)

Presently designing a box to mount these two boards and 16 TC sockets

16-channel TC box

Presently connected to the Fermilab Controls Network as “magis01-rpi.fnl.gov”

Bluetooth heater controller

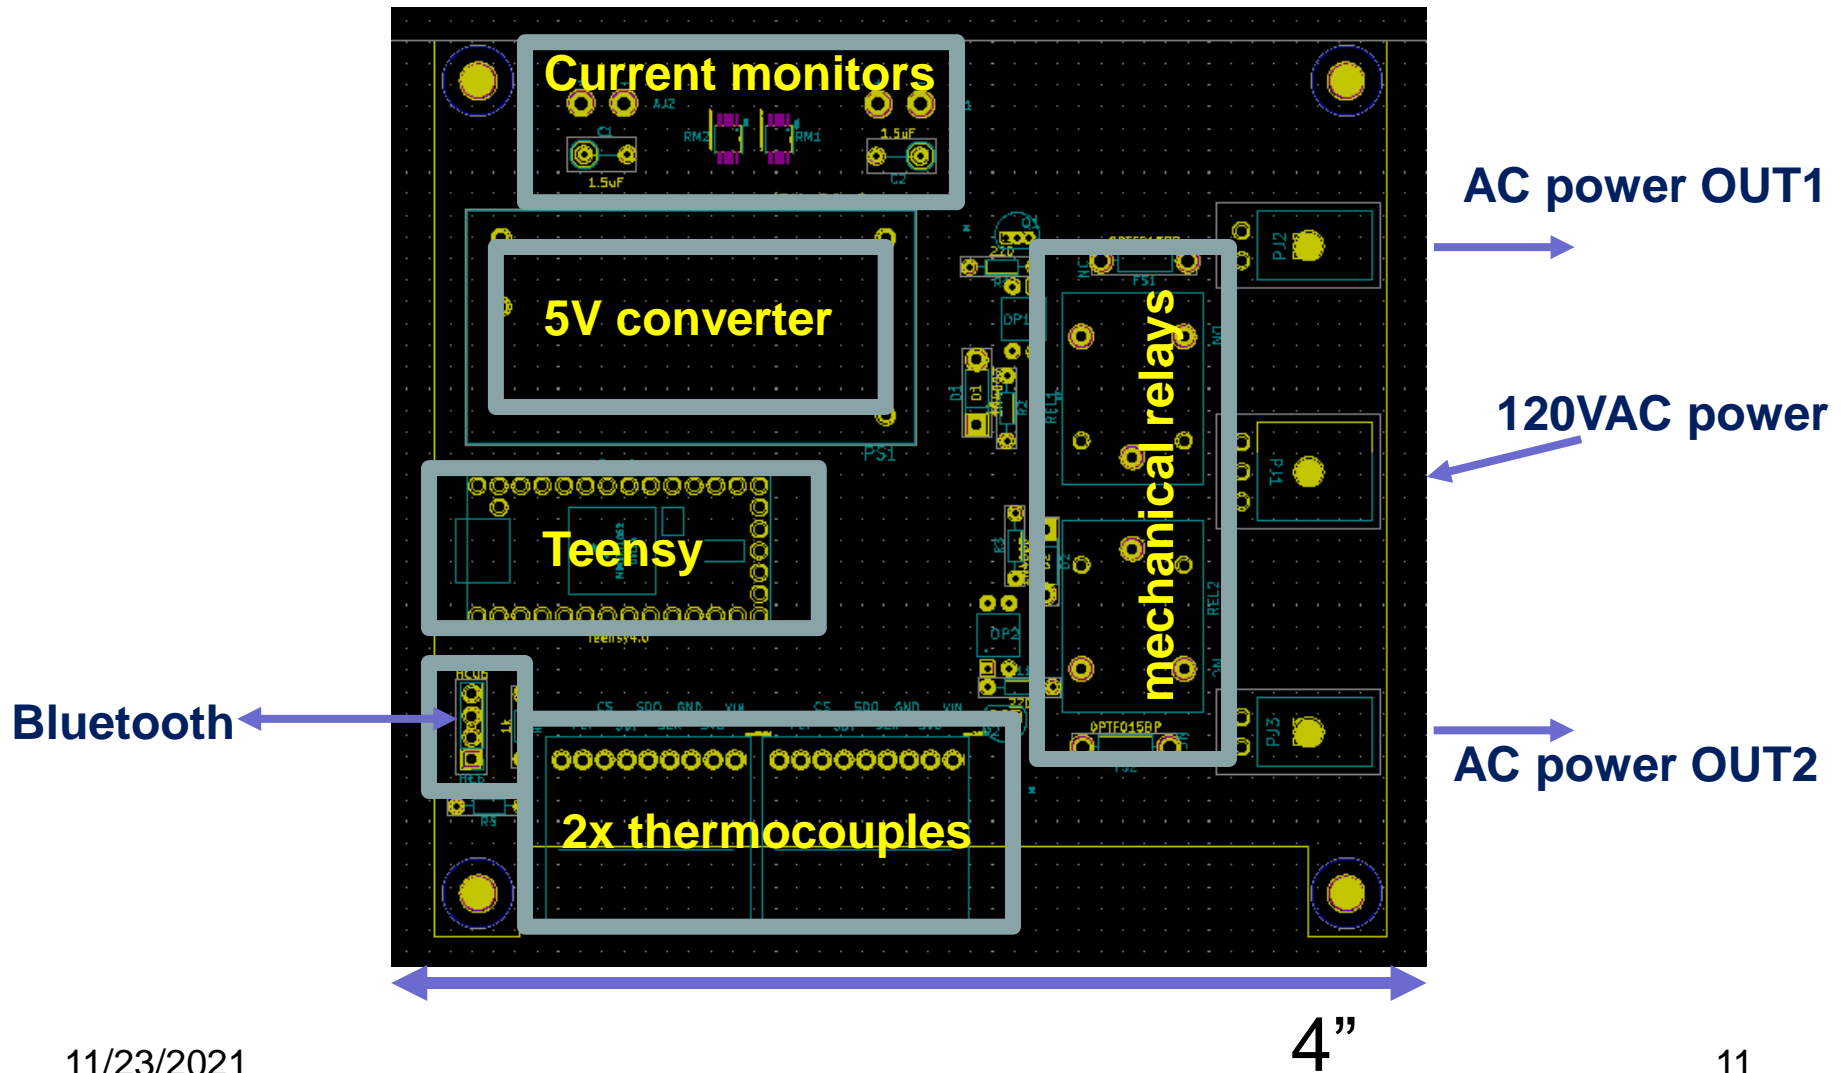

Controller:
2 Type T thermocouples
2 mechanical relays
Teensy 4.0 controller
Bluetooth HC06 serial port

Raspberry Pi 3B+

Presently connected to the Fermilab Controls Network as “magis-rpi.fnal.gov”
Being tested at Fermilab’s CMTF building with a 1-kW heat tape

Heater controller (2-channel)

Bluetooth heater controller

Bluetooth transceiver

Tests performed with full capacity of 7 Bluetooth serial connections per raspberry pi

Test setup at Fermilab

Proposed SSR

- Fotek SSR 10-DA

- ★ High Reliability by S.M.T. & TQC.
(Surface Mounting Technology)
- ★ High Isolation over than 50MΩ / 500VDC
- ★ High Dielectric over than 2.5KV
- ★ Low Enable Current less than 7.5mA / 12VDC
C MOS IC or TTL Compatible.
- ★ Low EMI / EFI & Surge by Zero Cross Trigger Method.
- ★ High Surge Current Duration Over 10 Times of Rated Current / One Cycle
- ★ High Surge Voltage Duration by Snubber Circuit.
- ★ 表面貼焊技術及全面品管，提供最可靠的 SSR
- ★ 高絕緣阻抗超過 50MΩ / 500VDC
- ★ 高耐壓超過 2.5KV
- ★ 低觸發電流小於 7.5mA / 12VDC，可與 CMOS IC及 TTL 匹配
- ★ 零點觸發方式避免電磁 / 高頻干擾
- ★ 高耐過電流，超過10倍額定電流/一週期
- ★ 具緩衝迴路可吸收瞬間突破

Control Method

Zero Cross Trigger Method

Output TURN ON or TURN OFF

only on Zero Cross Point of sine wave , may avoid surge
or EMI / RFI occurring.

Specially suited to control resistive , capacitive and
Non - saturated inductive loads.

SSR test

- Tested SSR with a 3.3 V direct output from Teensy 4.0
 - PWM: 5 Hz, ~50% duty factor

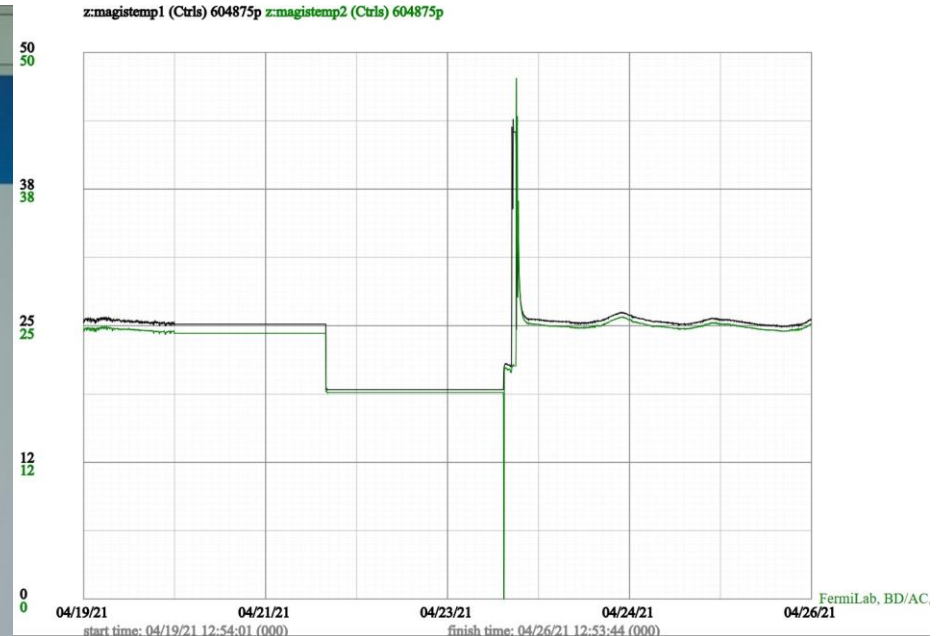

User interface

- Each RPi is running a Node.js web server via a Node-Red UI utility
- It also posts data to Fermilab ACNET (1 Hz rate)
 - ACNET provides datalogging capability
