Outline

Introduction

The hadronic light-by-light (HLbL) contribution ($O(\alpha^3)$)

Summary/Outlook

The magnetic moment of the muon

Interaction of particle with static magnetic field

$$V(\vec{x}) = -\vec{\mu} \cdot \vec{B}_{\text{ext}}$$

The magnetic moment $\vec{\mu}$ is proportional to its spin ($c = \hbar = 1$)

$$\vec{\mu} = g \left(\frac{e}{2m} \right) \vec{S}$$

The Landé **g -factor** is predicted from the **free Dirac eq.** to be

$$g = 2$$

for elementary fermions

The magnetic moment of the muon

In interacting **quantum** (field) theory g gets corrections

$$\gamma^\mu \rightarrow \Gamma^\mu(q) = \left(\gamma^\mu F_1(q^2) + \frac{i \sigma^{\mu\nu} q_\nu}{2m} F_2(q^2) \right)$$

which results from Lorentz and gauge invariance when the muon is on-mass-shell.

$$F_2(0) = \frac{g - 2}{2} \equiv a_\mu \quad (F_1(0) = 1)$$

(the anomalous magnetic moment, or anomaly)

The magnetic moment of the muon

Compute these corrections order-by-order in perturbation theory by expanding $\Gamma^\mu(q^2)$ in QED coupling constant

$$\alpha = \frac{e^2}{4\pi} = \frac{1}{137} + \dots$$

Corrections begin at $\mathcal{O}(\alpha)$; Schwinger term = $\frac{\alpha}{2\pi} = 0.0011614\dots$

hadronic contributions $\sim 6 \times 10^{-5}$ times smaller (leading error).

Electroweak (2-loop) needed too, New Physics? (SUSY...)

Experimental value (L. Roberts, INT WS) Dominated by BNL E821

E821 achieved ± 0.54 ppm. The e^+e^- based theory is at the ~ 0.4 ppm level. Difference is $\sim 3.6 \sigma$

$$a_{\mu}^{exp} = 116\,592\,089(63) \times 10^{-11} \quad (0.54 \text{ ppm})$$

$$\Delta a_{\mu} \equiv a_{\mu}^{exp} - a_{\mu}^{SM} = (287 \pm 80) \times 10^{-11}$$

Theory: arXiv:1010.4180v1 [hep-ph] Davier, Hoecker, Malaescu, and Zhang, Tau2010

Lee Roberts - INT Workshop on HLbL 28 February 2011

Theory value (standard model) (L. Roberts, INT WS)

The SM Value for a_μ from $e^+e^- \rightarrow \text{hadrons}$ (Updated 9/10)

CONTRIBUTION	RESULT ($\times 10^{-11}$) UNITS
QED (leptons)	$116\,584\,718.09 \pm 0.14 \pm 0.04_\alpha$
HVP(lo)	$6\,914 \pm 42_{\text{exp}} \pm 14_{\text{rad}} \pm 7_{\text{pQCD}}$
HVP(ho)	$-98 \pm 1_{\text{exp}} \pm 0.3_{\text{rad}}$
HLxL	105 ± 26
EW	$152 \pm 2 \pm 1$
Total SM	$116\,591\,793 \pm 51$

Outline

Introduction

The hadronic light-by-light (HLbL) contribution ($O(\alpha^3)$)

Summary/Outlook

HLbL

Model estimates put this $\mathcal{O}(\alpha^3)$ contribution at about $(10-12) \times 10^{-10}$ with a 25-40% uncertainty

No dispersion relation *a'la* vacuum polarization

Lattice regulator: model independent, approximations systematically improvable

Lattice QCD: conventional approach

Correlation of 4 EM currents
 $\Pi^{\mu\nu\rho\sigma}(q, p_1, p_2)$

Two independent momenta
 + external mom q

Compute for all possible
 values of p_1 and p_2 , ($\mathcal{O}(V^2)$)
 four index tensor (32 Lorentz
 structures for $g-2!$)

several q , (extrap $q \rightarrow 0$),
 fit, plug into perturbative QED
 two-loop integrals

New approach (QCD+QED on the lattice)

Average over combined gluon
and photon gauge configurations

Quarks coupled to gluons and
photons

muon coupled to photons

[hep-lat/0509016;

Chowdhury *et al.* (2008);

Chowdhury Ph. D. thesis (2009)]

New approach (QCD+QED on the lattice)

Attach one photon by hand (see why in a minute)

Correlation of hadronic loop and muon line

[hep-lat/0509016;

Chowdhury *et al.* (2008);

Chowdhury Ph. D. thesis (2009)]

New approach: Formally expand in α

The leading and next-to-leading contributions in α to magnetic part of correlation function come from

New approach: Subtraction of lowest order piece

Subtraction term is product of separate averages of the loop and line

Gauge configurations identical in both, so two are **highly correlated**

In PT, correlation function and subtraction have **same contributions except the light-by-light** term which is absent in the subtraction

F_2 ($m_\mu/m_e = 40$, QED only) (Chowdhury Ph. D. thesis, UConn, 2009)

$$F_2 = (3.96 \pm 0.70) \times 10^{-4}$$

- ▶ $e = 1$
 - ▶ $16^3 \times 32$ lattice size
 - ▶ lowest non-zero momentum only
 - ▶ **stat error only**
- ▶ Expected size of enhancement (compared to $m_\mu/m_e = 1$)
 - ▶ Continuum PT result: $\approx 10(\alpha/\pi)^3 = 1.63 \times 10^{-4}$ ($e = 1$)
 - ▶ roughly consistent with PT result, large finite volume effect

F_2 , $m_\mu/m_e = 40$, finite volume study (QED only)

- ▶ Repeat calculation with 24^3 lattice volume
- ▶ Bigger box $F_2 = (1.19 \pm 0.32) \times 10^{-4}$
- ▶ Small box $F_2 = (3.96 \pm 0.70) \times 10^{-4}$
- ▶ finite volume effects manageable
- ▶ Continuum PT result: $\approx 10(\alpha/\pi)^3 = 1.63 \times 10^{-4}$ ($e = 1$)
- ▶ Roughly consistent with PT result

$a_\mu(\text{HLbL})$ in 2+1f QCD+QED (PRELIMINARY)

- ▶ Same as before, but with $U = U(1) \times SU(3)$
- ▶ QCD in the loop only (same in subtraction)
- ▶ QED in both loop and line
- ▶ 2+1 flavors (u, d, s) of DWF (RBC/UKQCD)
- ▶ $a = 0.114$ fm, $16^3 \times 32 (\times 16)$, $a^{-1} = 1.73$ GeV
- ▶ $m_q \approx 0.013$, $m_\pi \approx 420$ MeV
- ▶ $m_\mu \approx 692$ MeV ($m_\mu^{\text{phys}} = 105.658367(4)$ MeV)
- ▶ 100 configurations (one QED conf. for each QCD conf.)
- ▶ $(N_s/4)^3 = 64$ (loop) propagator calculations/configuration

$a_\mu(\text{HLbL})$ in 2+1f lattice QCD+QED (PRELIMINARY)

- ▶ $a_\mu(\text{HLbL}) = (-15.7 \pm 2.3) \times 10^{-5}$ (lowest non-zero mom, $e = 1$)
- ▶ HLbL amplitude depends strongly on m_μ (m_μ^2 in models)
- ▶ Magnitude 5-10 times bigger, sign opposite from models
- ▶ models not expected to be accurate in this regime
- ▶ Check subtraction is working by varying $e = 0.84, 1.19$
 - ▶ HLbL amplitude ($\sim e^4$) changes by ~ 0.5 and 2 ✓
 - ▶ while unsubtracted amplitude stays the same ✓

$a_\mu(\text{HLbL})$ in 2+1f lattice QCD+QED (PRELIMINARY)

- ▶ Easy to lower muon mass (muon line is cheap)
- ▶ Try $m_\mu \approx 190$ MeV
- ▶ $a_\mu(\text{HLbL}) = (-2.2 \pm 0.8) \times 10^{-5}$ (lowest non-zero mom, $e = 1$). Right direction...

$a_\mu(\text{HLbL})$ in 2+1 flavor lattice QCD+QED

- ▶ Try larger lattice 24^3 ($((2.7 \text{ fm})^3)$)
- ▶ Pion mass is smaller too, $m_\pi = 329 \text{ MeV}$
- ▶ Same muon mass
- ▶ two lowest values of Q^2 (0.11 and 0.18 GeV^2)
- ▶ Use **All Mode Averaging** (AMA) (Izubuchi, Shintani)
 - ▶ 6^3 point sources/configuration (216)
 - ▶ AMA approximation: “sloppy CG”, $r_{\text{stop}} = 10^{-4}$

$a_\mu(\text{HLbL})$ in 2+1f lattice QCD+QED (PRELIMINARY) $F_2(Q^2)$ stable with additional measurements (20 \rightarrow 40 \rightarrow 80 configs) 24^3 $Q^2 = 0.11 \text{ and } 0.18 \text{ GeV}^2$ $m_\pi \approx 329 \text{ MeV}$ $m_\mu \approx 190 \text{ MeV}$

$a_\mu(\text{HLbL})$ in 2+1f lattice QCD+QED (PRELIMINARY)

Signal may be emerging in the model ballpark:

- ▶ $F_2(0.18 \text{ GeV}^2) = (0.142 \pm 0.067) \times \left(\frac{\alpha}{\pi}\right)^3$
- ▶ $F_2(0.11 \text{ GeV}^2) = (0.038 \pm 0.095) \times \left(\frac{\alpha}{\pi}\right)^3$
- ▶ $a_\mu(\text{HLbL}/\text{model}) = (0.084 \pm 0.020) \times \left(\frac{\alpha}{\pi}\right)^3$

Lattice size 24^3 , $m_\pi = 329 \text{ MeV}$, $m_\mu \approx 190 \text{ MeV}$

model value/error is “Glasgow Consensus” (arXiv:0901.0306 [hep-ph])

HLbL systematic error

“Disconnected” diagrams (quark loops connected by gluons)
not calculated yet (not suppressed).

Several possibilities,

1. Use multiple valence quark loops (qQED)
2. Re-weight in α (T. Ishikawa) or dynamical QED in HMC
3. “ \mathcal{A} source” (see Izubuchi’s talk) (no subtraction)

HLbL systematics

Need to address

- ▶ Finite volume
- ▶ $q^2 \rightarrow 0$ exptrap
- ▶ $m_q \rightarrow m_{q, \text{phys}}$
- ▶ $m_\mu \rightarrow m_{\mu, \text{phys}}$
- ▶ excited states/“around the world” effects
- ▶ $a \rightarrow 0$
- ▶ QED renormalization
- ▶ ...

Outline

Introduction

The hadronic light-by-light (HLbL) contribution ($O(\alpha^3)$)

Summary/Outlook

Summary/Outlook

- ▶ Demanding, but straightforward calculation
- ▶ Early HLbL lattice calculation encouraging
- ▶ Intermediate lattice calculations to check models (four-point, $\pi \rightarrow \gamma^* \gamma$, chiral susceptibility, ...)
- ▶ Optimistic lattice+models+expt can reach 10% goal in ~ 5 years (INT WS on HLbL, Feb. 2011)
- ▶ White papers, prospects for lattice QCD:
 - ▶ USQCD white-paper (<http://www.usqcd.org/collaboration.html>)
 - ▶ Fundamental physics at the Intensity Frontier white-paper (arXiv:1205.2671 [hep-ex])
- ▶ Expected precision
 - ▶ E989: 0.14 PPM (factor of 3-4 better than E821)
 - ▶ SM theory, HVP: 0.3% (factor of 2)
 - ▶ SM theory, HLbL 10% or better (?)
 - ▶ Same central values, a_μ discrepancy $\rightarrow 5-8 \sigma$
