Latest results from JSNS^2 and status of JSNS^2-II

Jungsic Park (Kyungpook National University)
On behalf of the JSNS^2 / JSNS^2-II collaboration

NuFACT 2022, July 31 - August 6, 2022

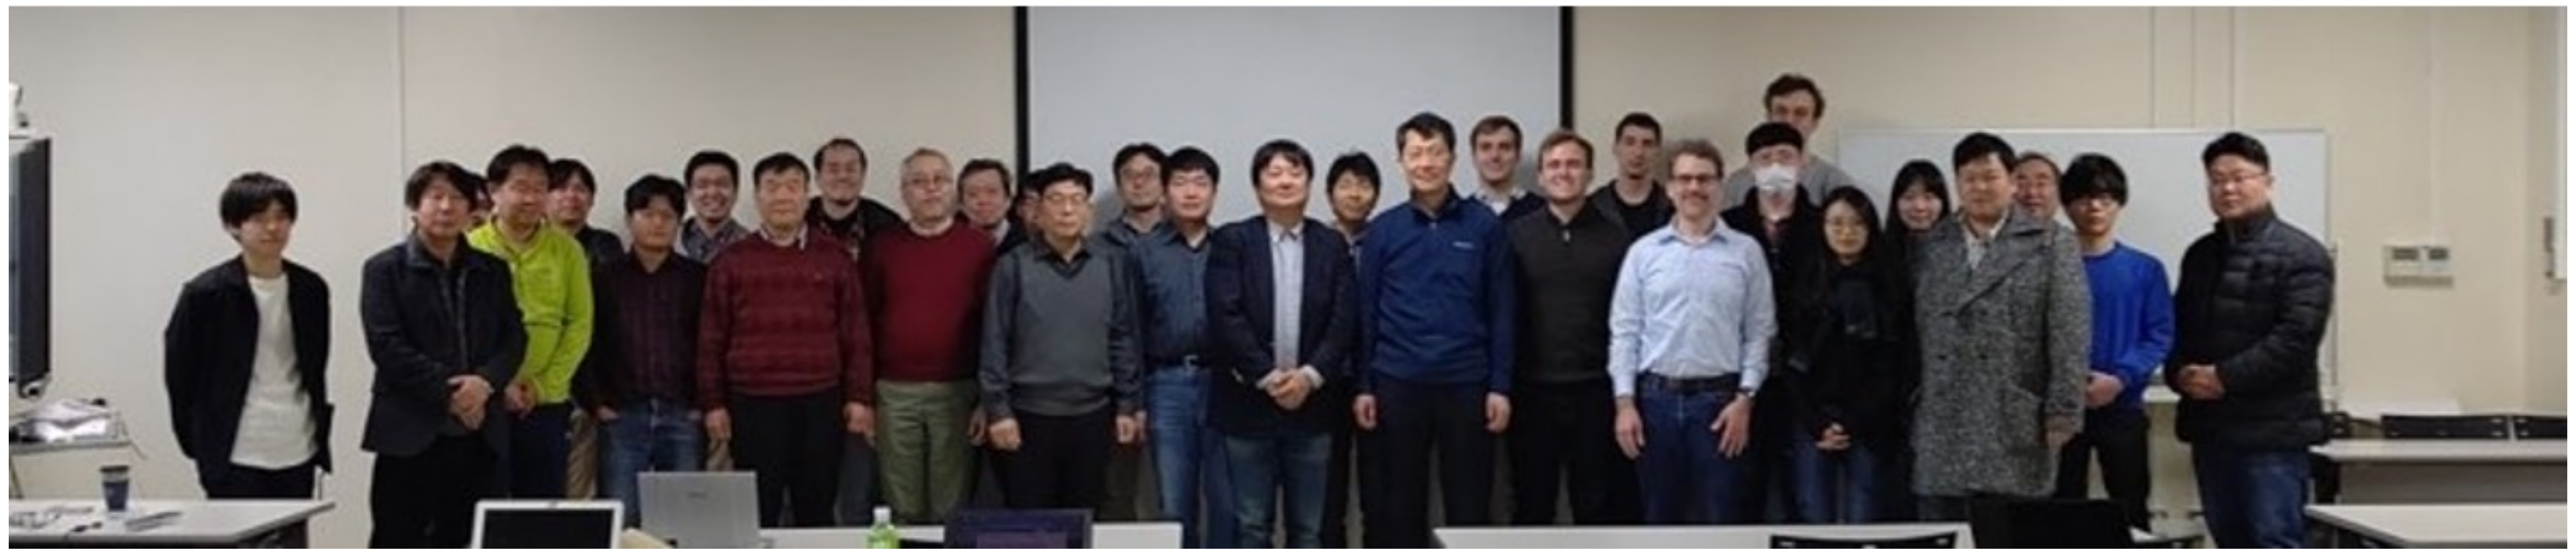
Talks in the parallel sessions

- (WG 6) Tuesday, 04:00 PM: “Gain calibration using dark hits in off-time region of regular data at JSNS^2 experiment”
- (WG 1) Thursday, 05:28 PM: “Status of the KDAR neutrino search with JSNS^2 experiment”

JSNS^2 / JSNS^2-II Collaboration

(J-PARC Sterile Neutrino Search at J-PARC Spallation Neutron Source)

Collaboration meeting @ J-PARC (2020/Feb)



JSNS^2 collaboration (61 collaborators)

- 10 Korean institutions (24 members)
- 6 Japanese institutions (29 members)
- 4 US institutions (7 members)
- 1 UK institution (1 member)

Indication of a sterile neutrino ($\Delta m^2 \sim 1 eV^2$)
(Direct test of the LSND)

Experiments (Neutrino source, signal, significance, energy, baseline)

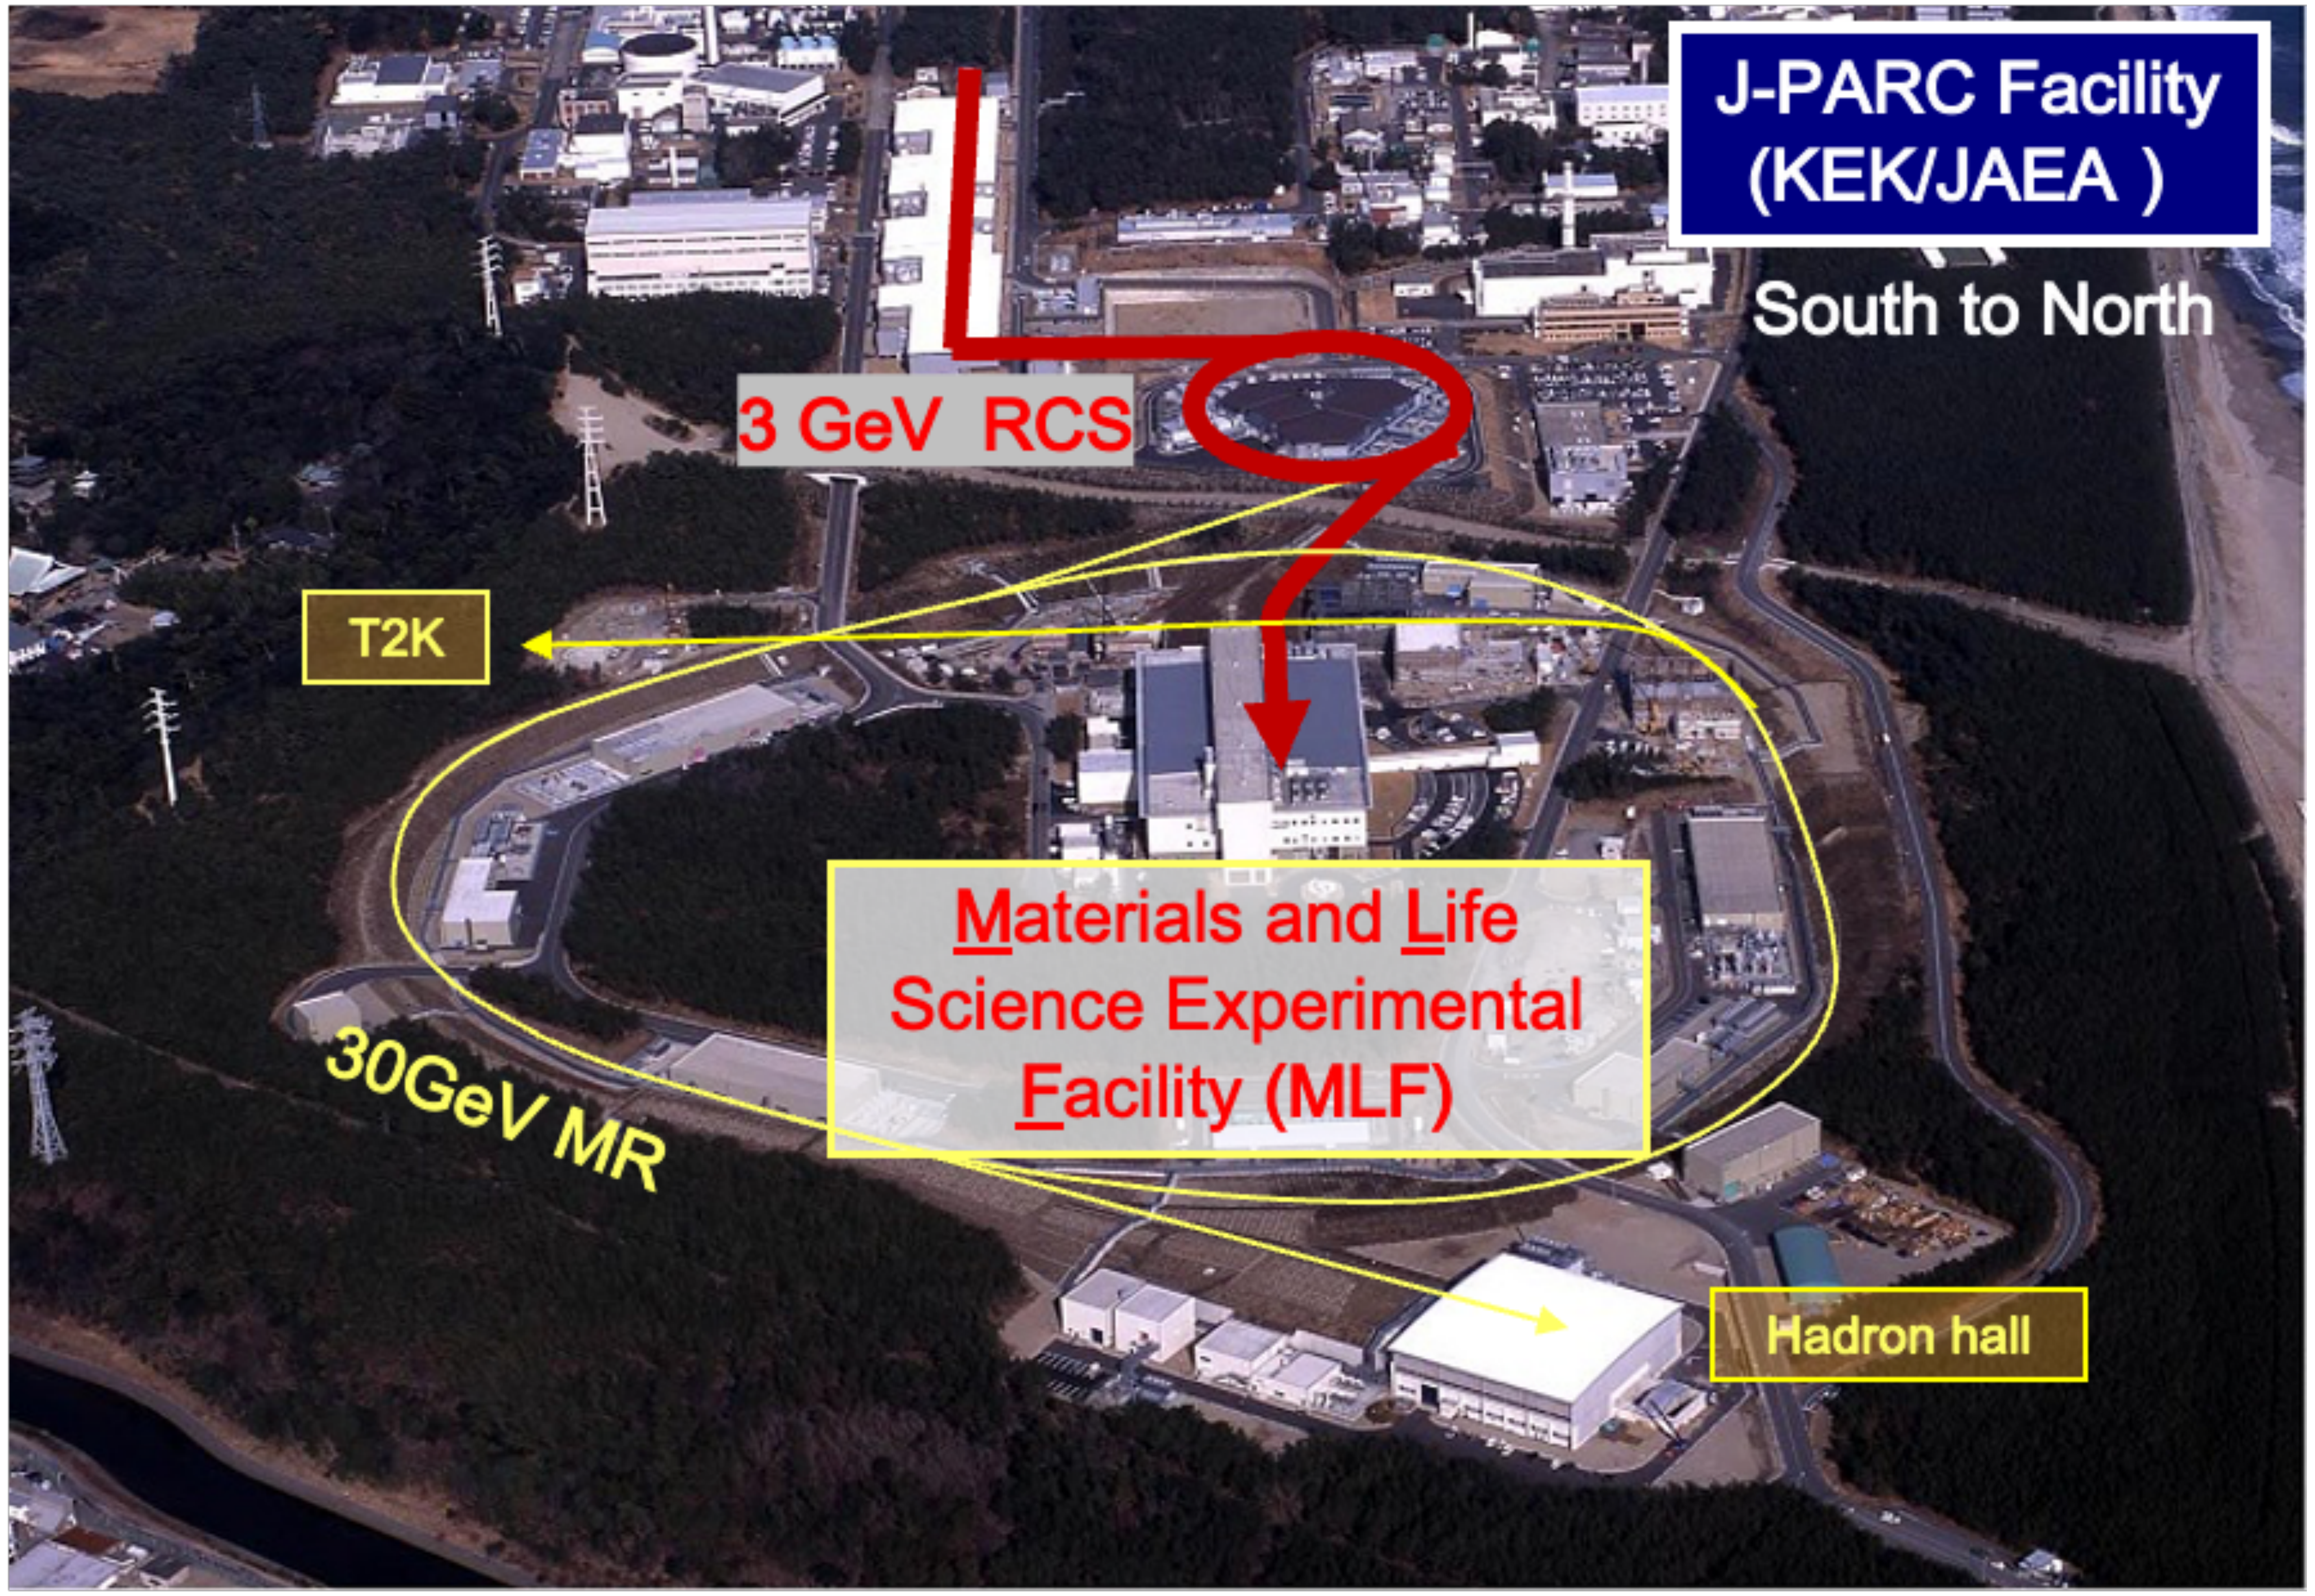
- **LSND** (μ Decay-At-Rest, $\bar{\nu}_\mu \to \bar{\nu}_e$, 3.8 σ, 40 MeV, 30 m)
- **MiniBooNE** (π Decay-In-Flight, $\nu_\mu \to \nu_e$, $\bar{\nu}_\mu \to \bar{\nu}_e$, 4.8 σ (combined), 800 MeV, 600 m)
- **BEST** (e capture, $\nu_e \to \nu_x$, ~4 σ, < 3 MeV, 10 m)
- **Reactors** (Beta decay, $\bar{\nu}_e \to \bar{\nu}_x$, significance varies, 1-8 MeV, 10 - 100 m)

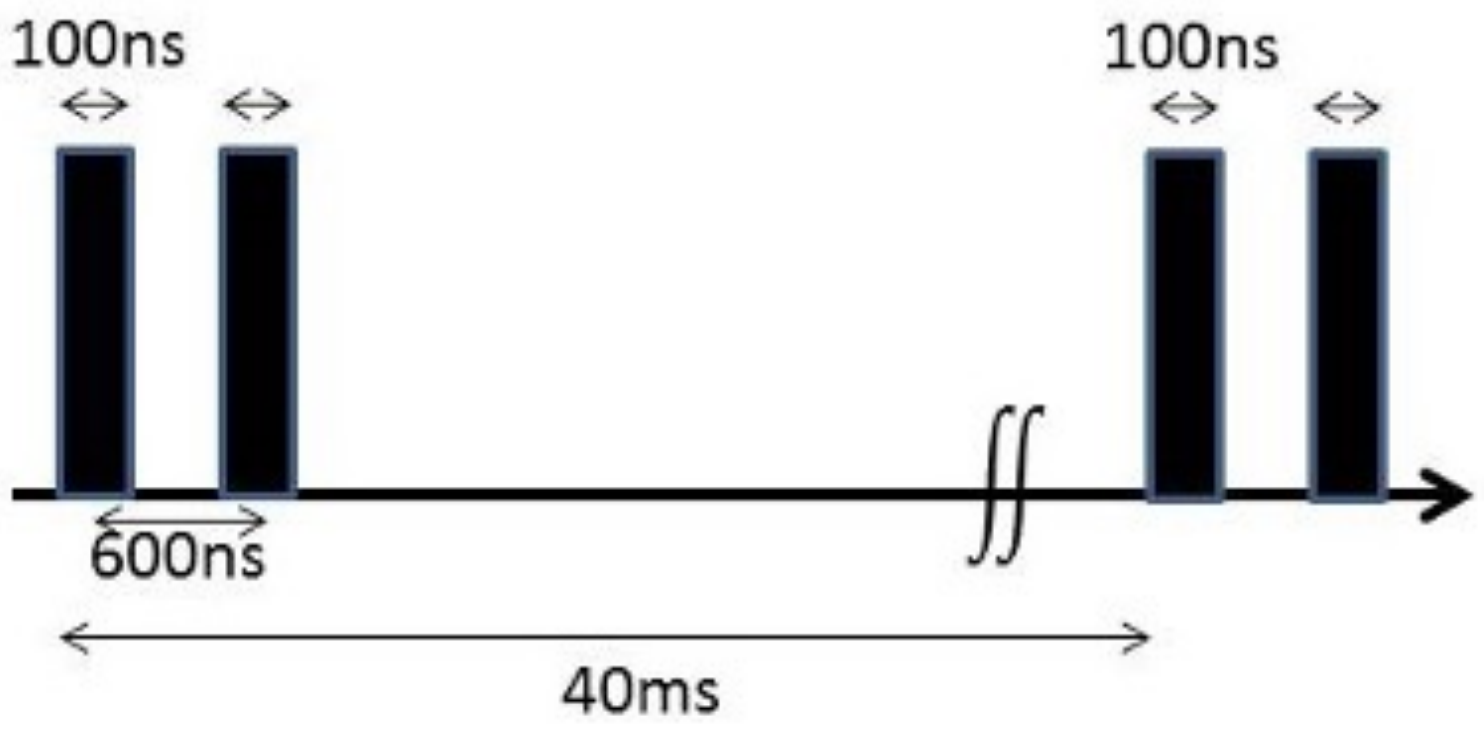
JSNS^2 uses the **same** neutrino source (μ), target (H), and detection principle (IBD) **as the LSND**

- Even if the excess is not due to the oscillation, JSNS^2 can catch this directly.

Two advantages: **short-pulsed beam** and **use of the gadolinium(Gd)-loaded liquid scintillator**

J-PARC Facility



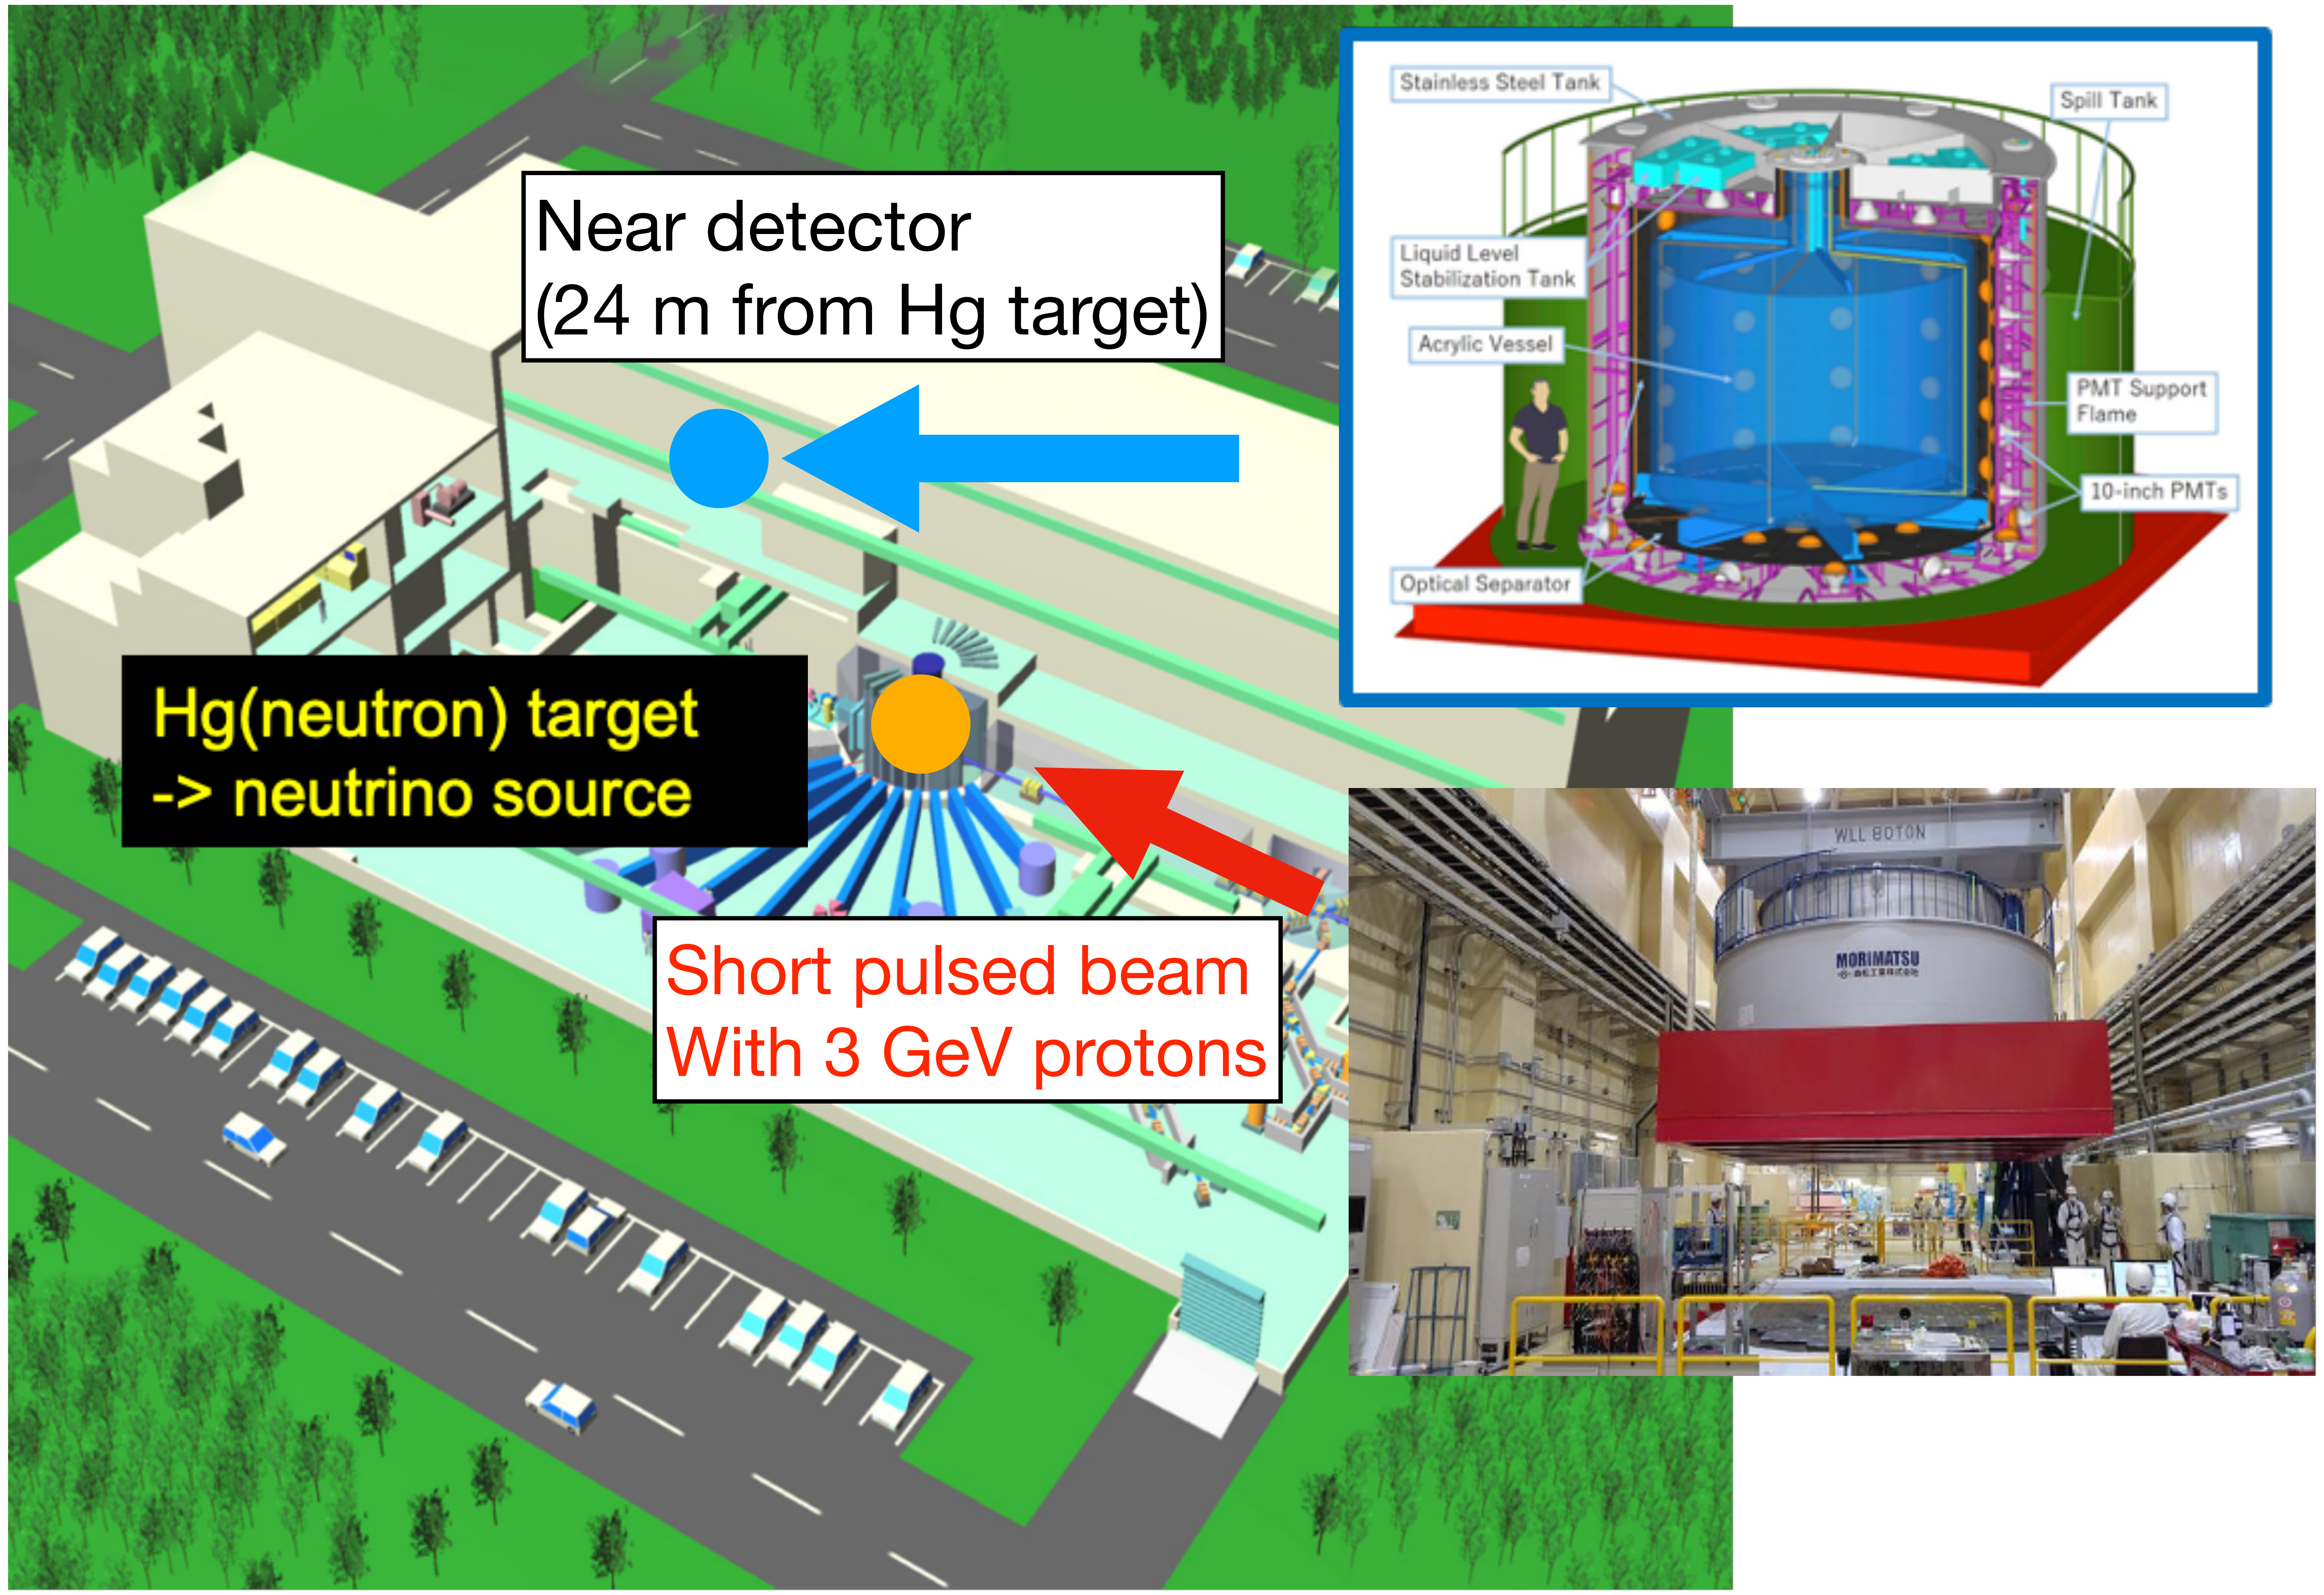


Low duty factor beam
(short-pulses + low repetition rate)
Gives an excellent signal to noise ratio

1 MW (design)

0.6 MW (2021/Jan - Apr/5)
0.7 MW (2021/Apr/5 - June/22)
0.7 MW (2022/Jan/28 - Apr/6)
0.8 MW (2022/Apr/7 -)

JSNS² detector and data taking



17 tons target, Gd-LS + 10% DIN
120, 10-inch PMTs

Commissioning (2020)

- Calibration
- Beam data with 25 us window
- Eur. Phys. J. C (2022) 82:331

First long physics run (2021)

- Smooth data taking (0.5 years)
- Beam power: 0.6 - 0.7 MW
- Analyses: in progress

Second long physics run (2022)

- Jan/28 - May/31
- Beam power: 0.7 - 0.8 MW

Operation

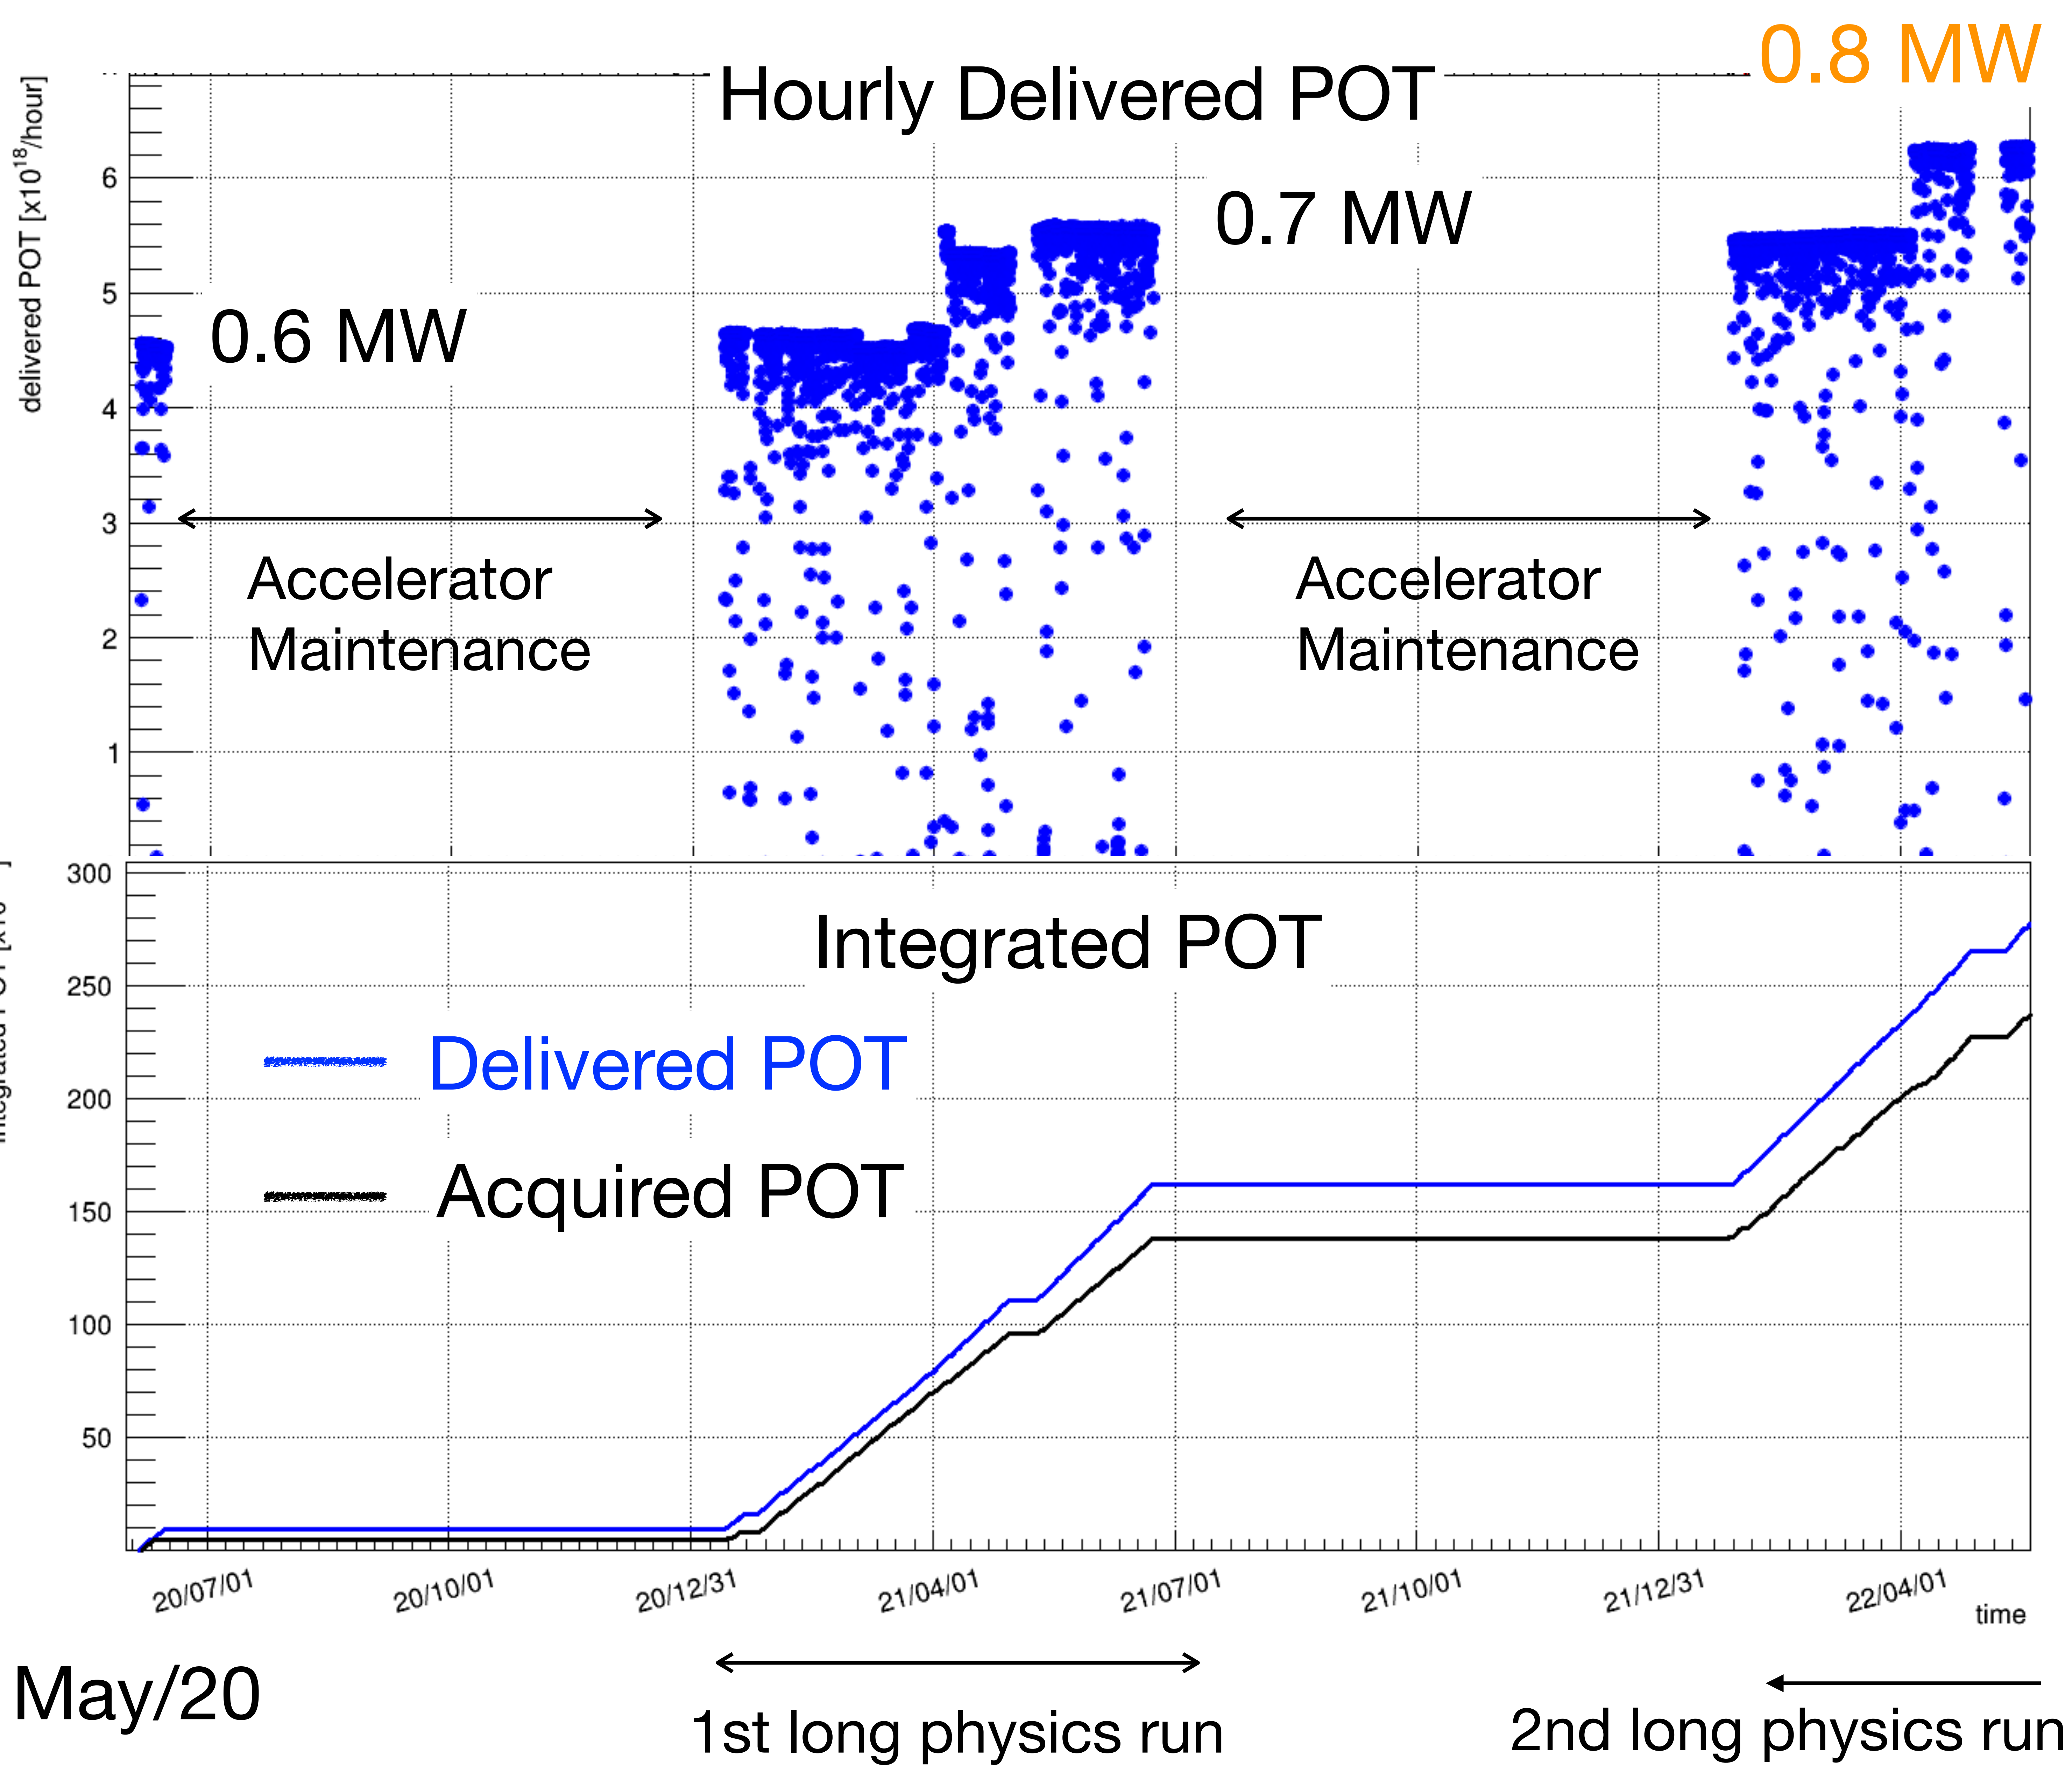
1st long physics run

- 0.6 MW (2021/Jan - Apr/5)
- 0.7 MW (2021/Apr/5 - June/22)

2nd long physics run

- 0.7 MW (2022/Jan/28 - Apr/6)
- 0.8 MW (2022/Apr/7 - May/31)

There is an accelerator maintenance period every year



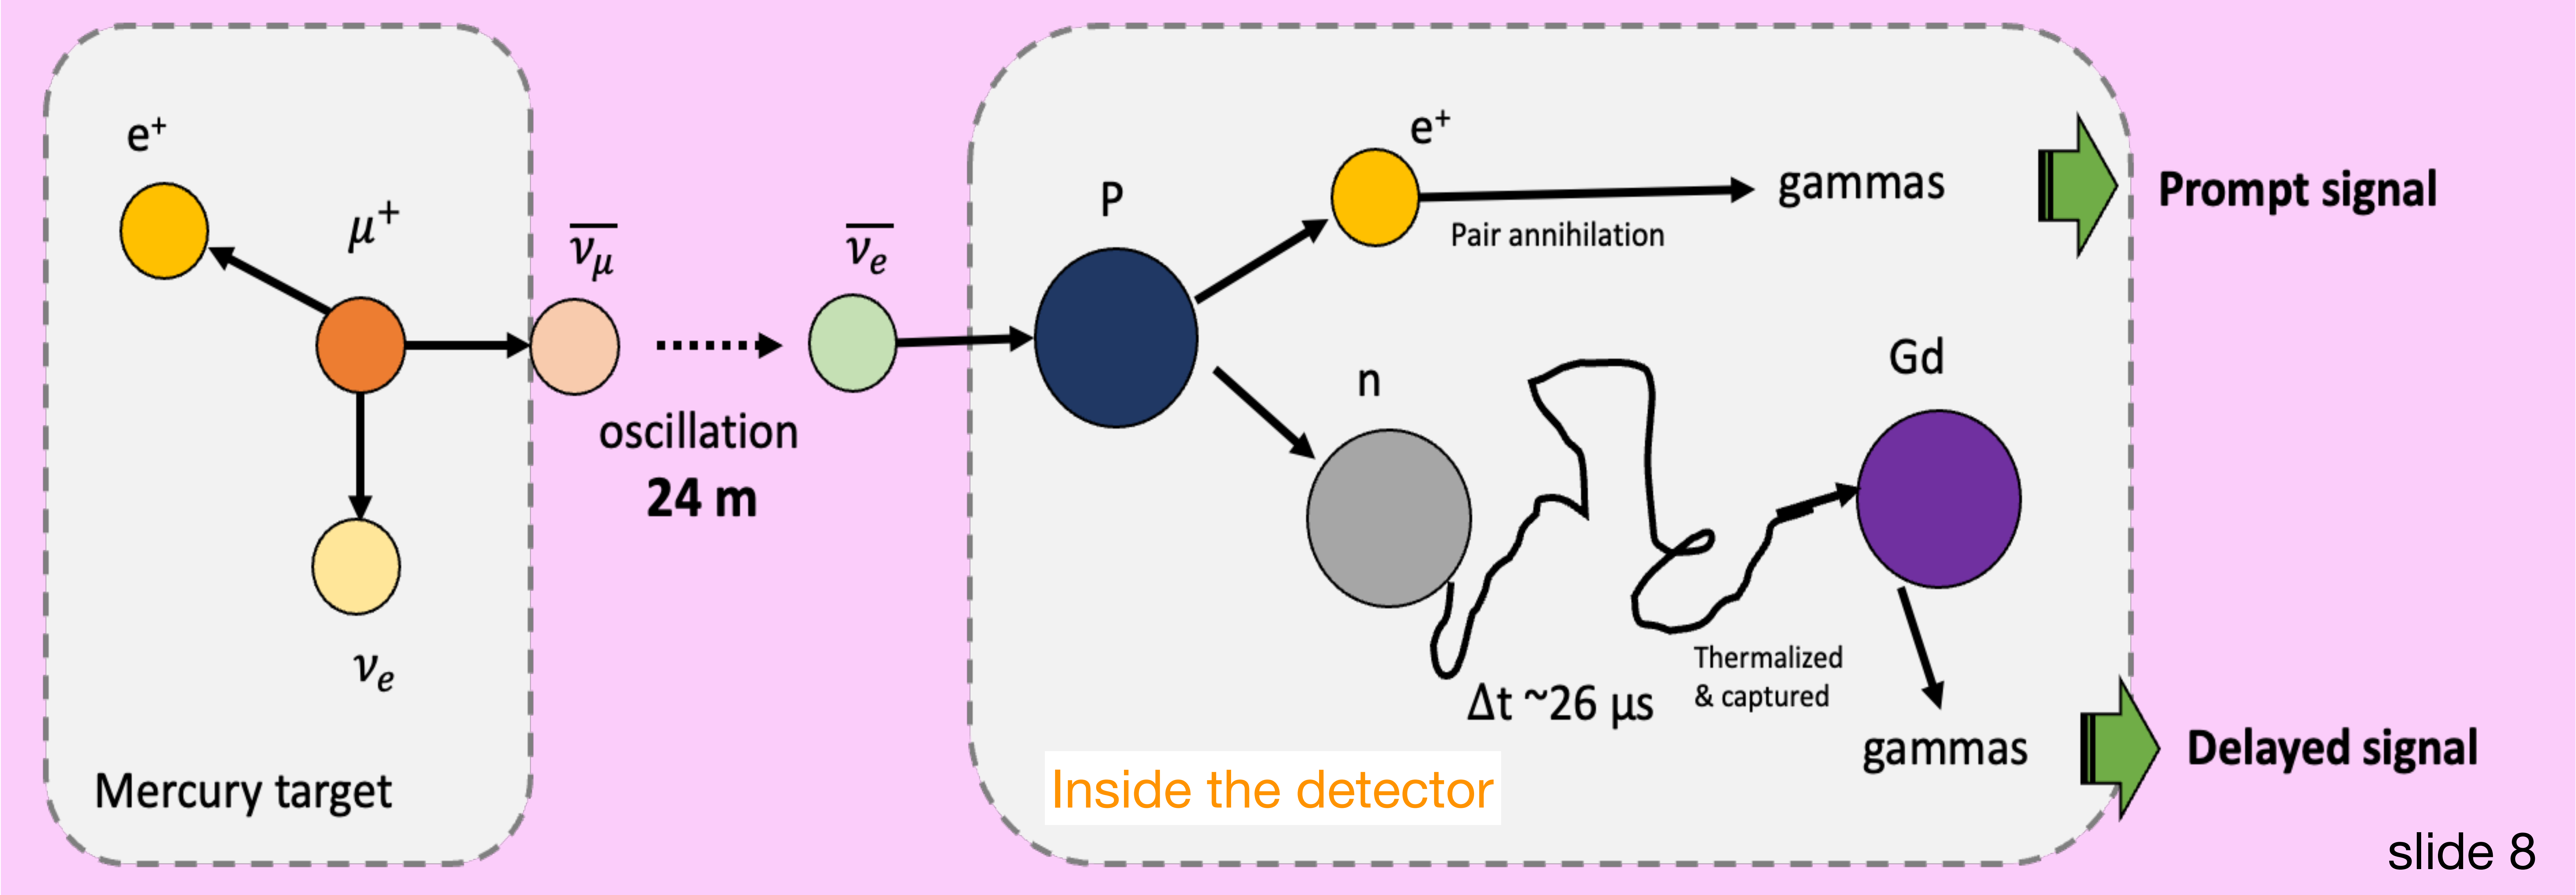
2.77×10^{22} POT has been delivered by May/20
(23 % of the approved POT of JSNS²)

Sterile neutrino

(Production and detection)

A double coincidence between
- The positron annihilation and
- Gammas from neutron captured on gadolinium (Gd)

	Timing	Energy
prompt	$1.5 \lesssim T_p \lesssim 10$ μs	$20 \lesssim E \lesssim 60$ MeV
delayed	$\Delta T_{p\text{-}d} < 100$ μs	$7 \lesssim E \lesssim 12$ MeV

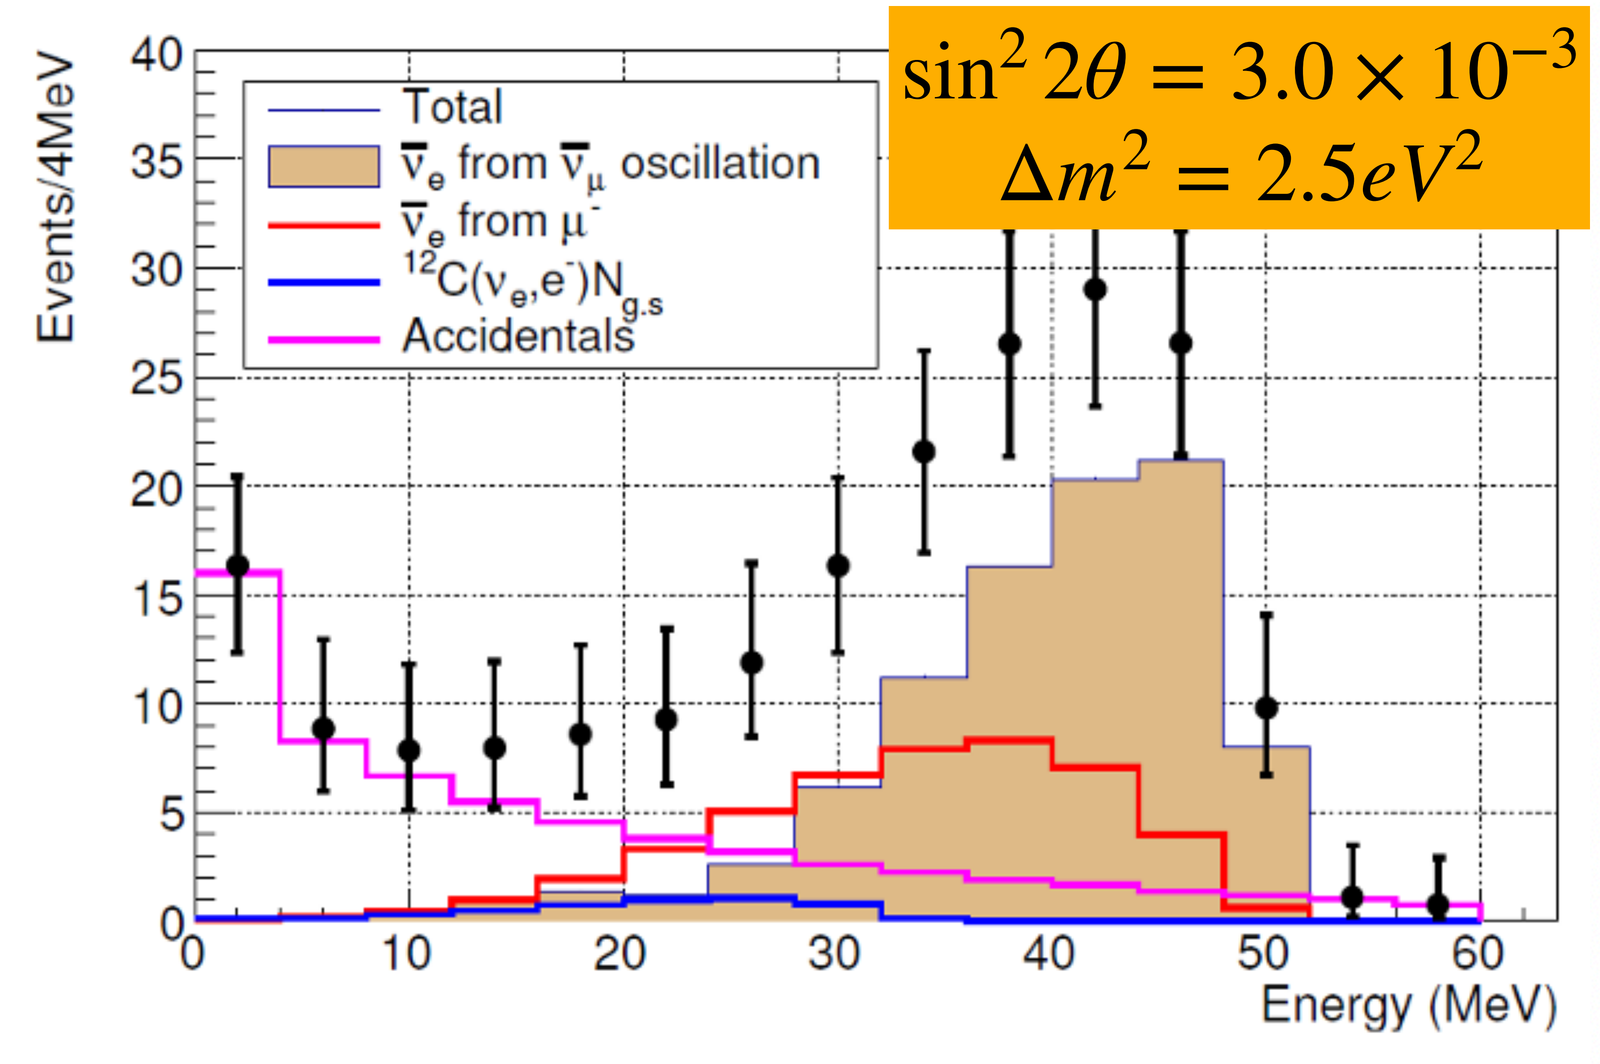


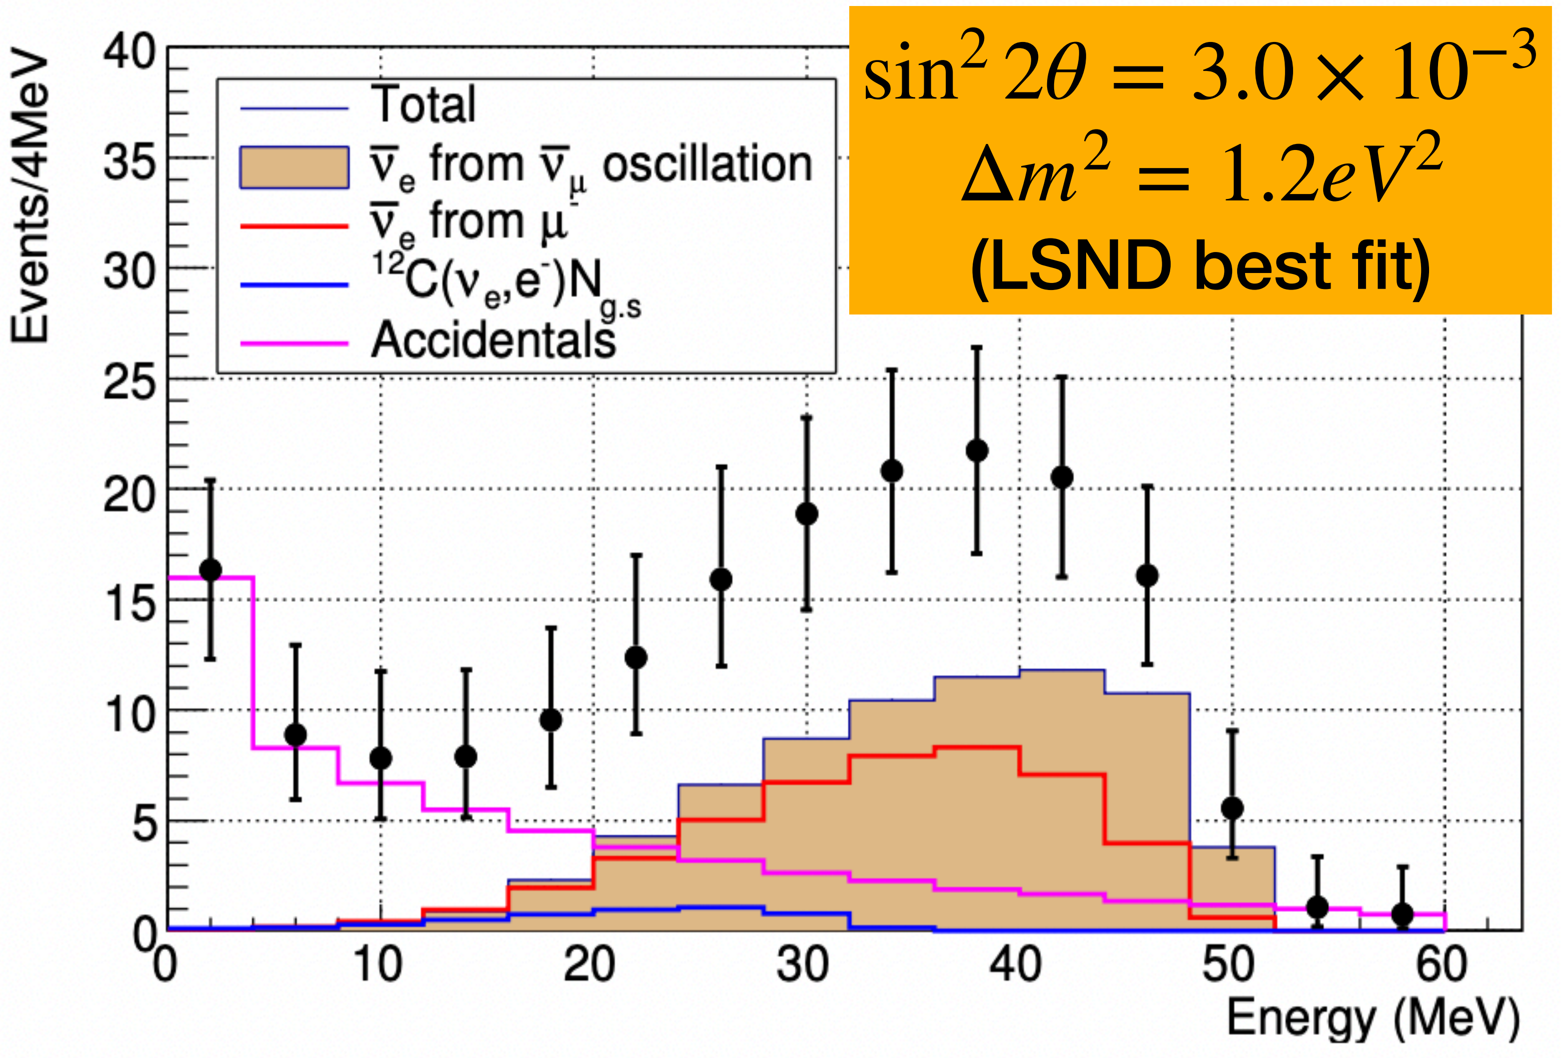
Expected visible energy and sensitivity

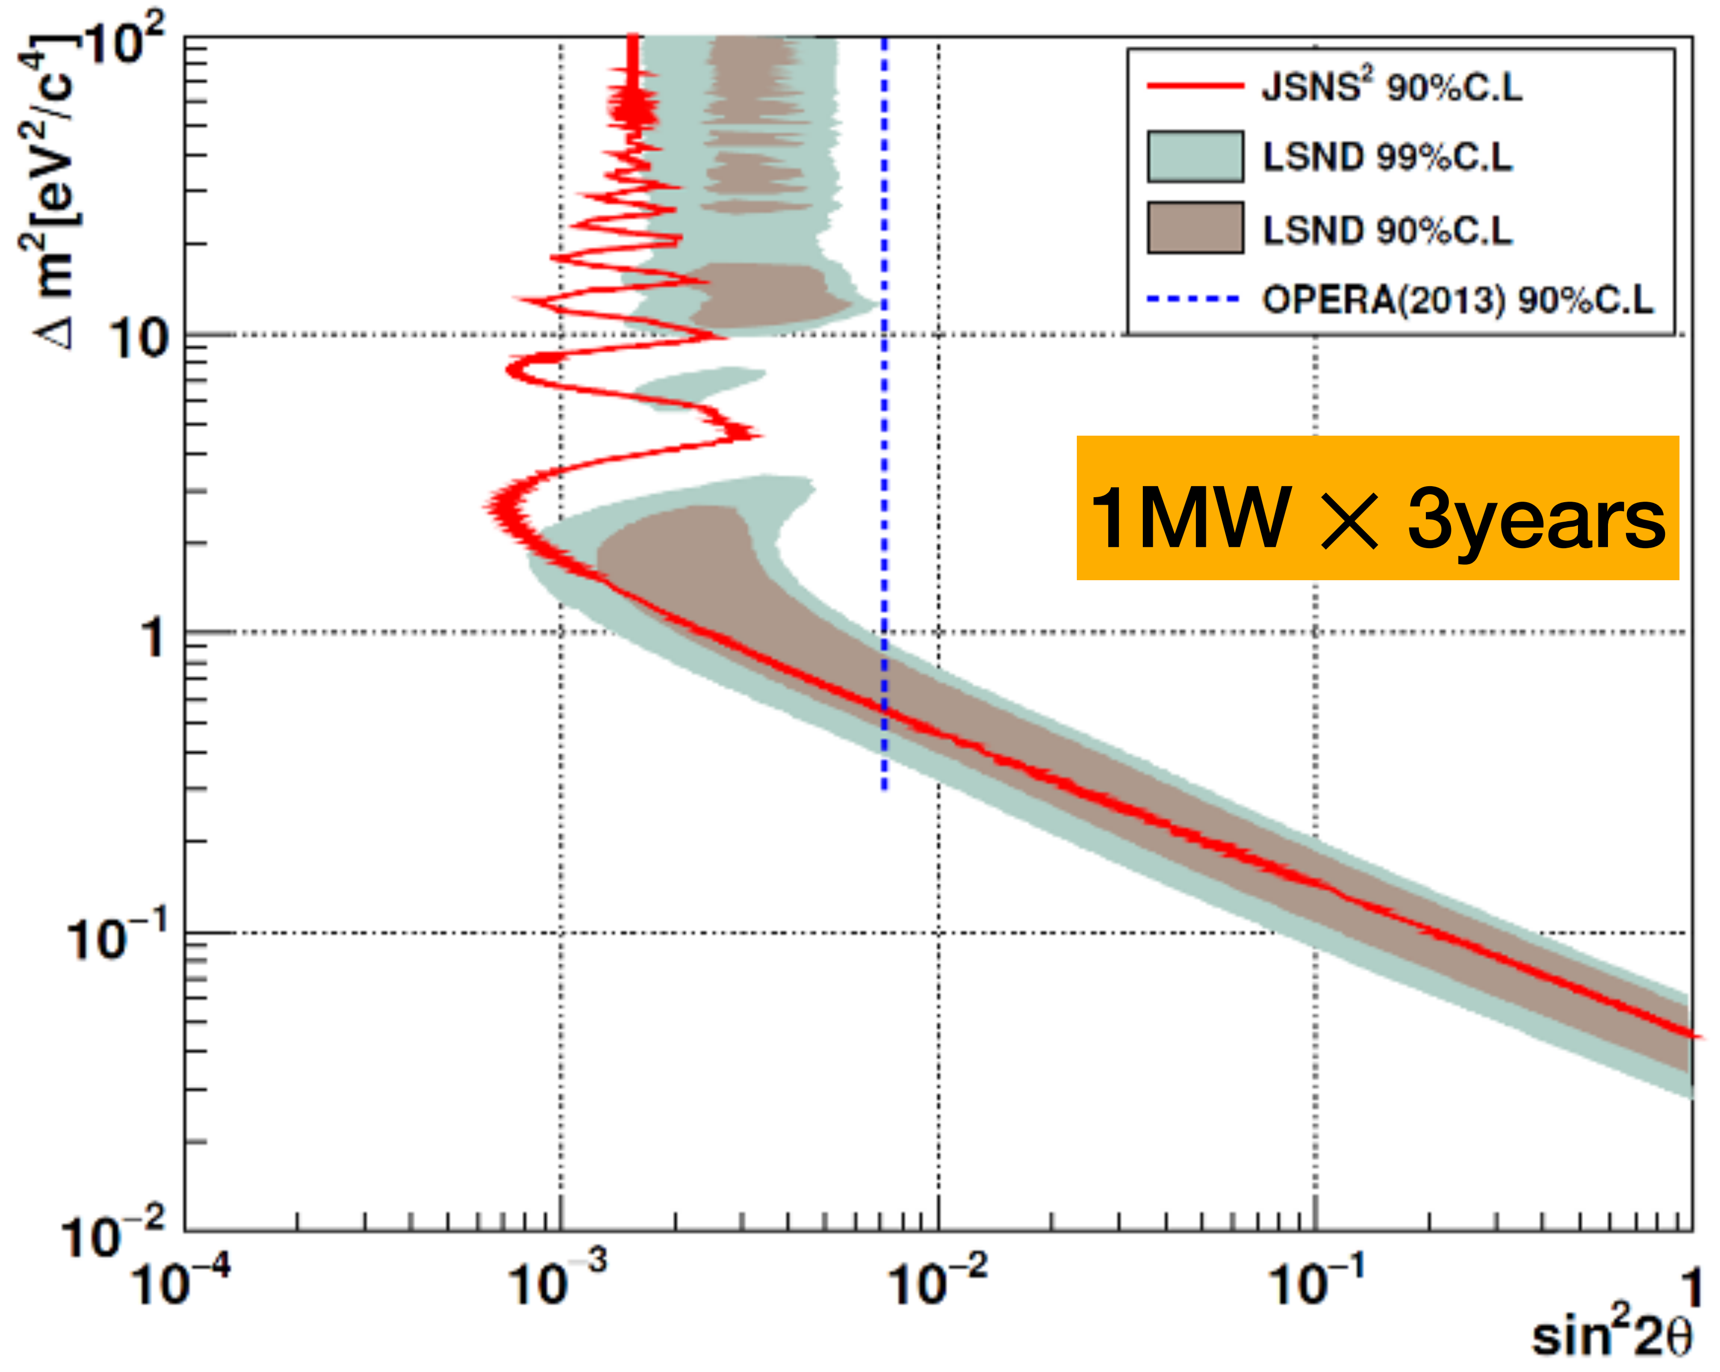
(From JSNS² TDR, arXiv:1705.08629)

Signal	$sin^2 2\theta = 3.0 \times 10^{-3}$ $\Delta m^2 = 2.5eV^2$ (Best fit values of MLF)	87
	$sin^2 2\theta = 3.0 \times 10^{-3}$ $\Delta m^2 = 1.2eV^2$ (Best fit values of LSND)	62
background	$\overline{\nu}_e$ from μ^-	43
	$^{12}C(\nu_e, e^-)^{12}N_{g.s.}$	3
	beam-associated fast n	$\leq$2
	Cosmic-induced fast n	negligible
	Total accidental events	20

- $\bar{\nu}_e$ follows decay-at-rest $\bar{\nu}_\mu$ energy distribution
- Prompt candidate: ~3.9×10^{-4} per spill
- Delayed candidate: ~4.4×10^{-3} per spill
- Spectral fit is sensitive to the difference of energy spectrum



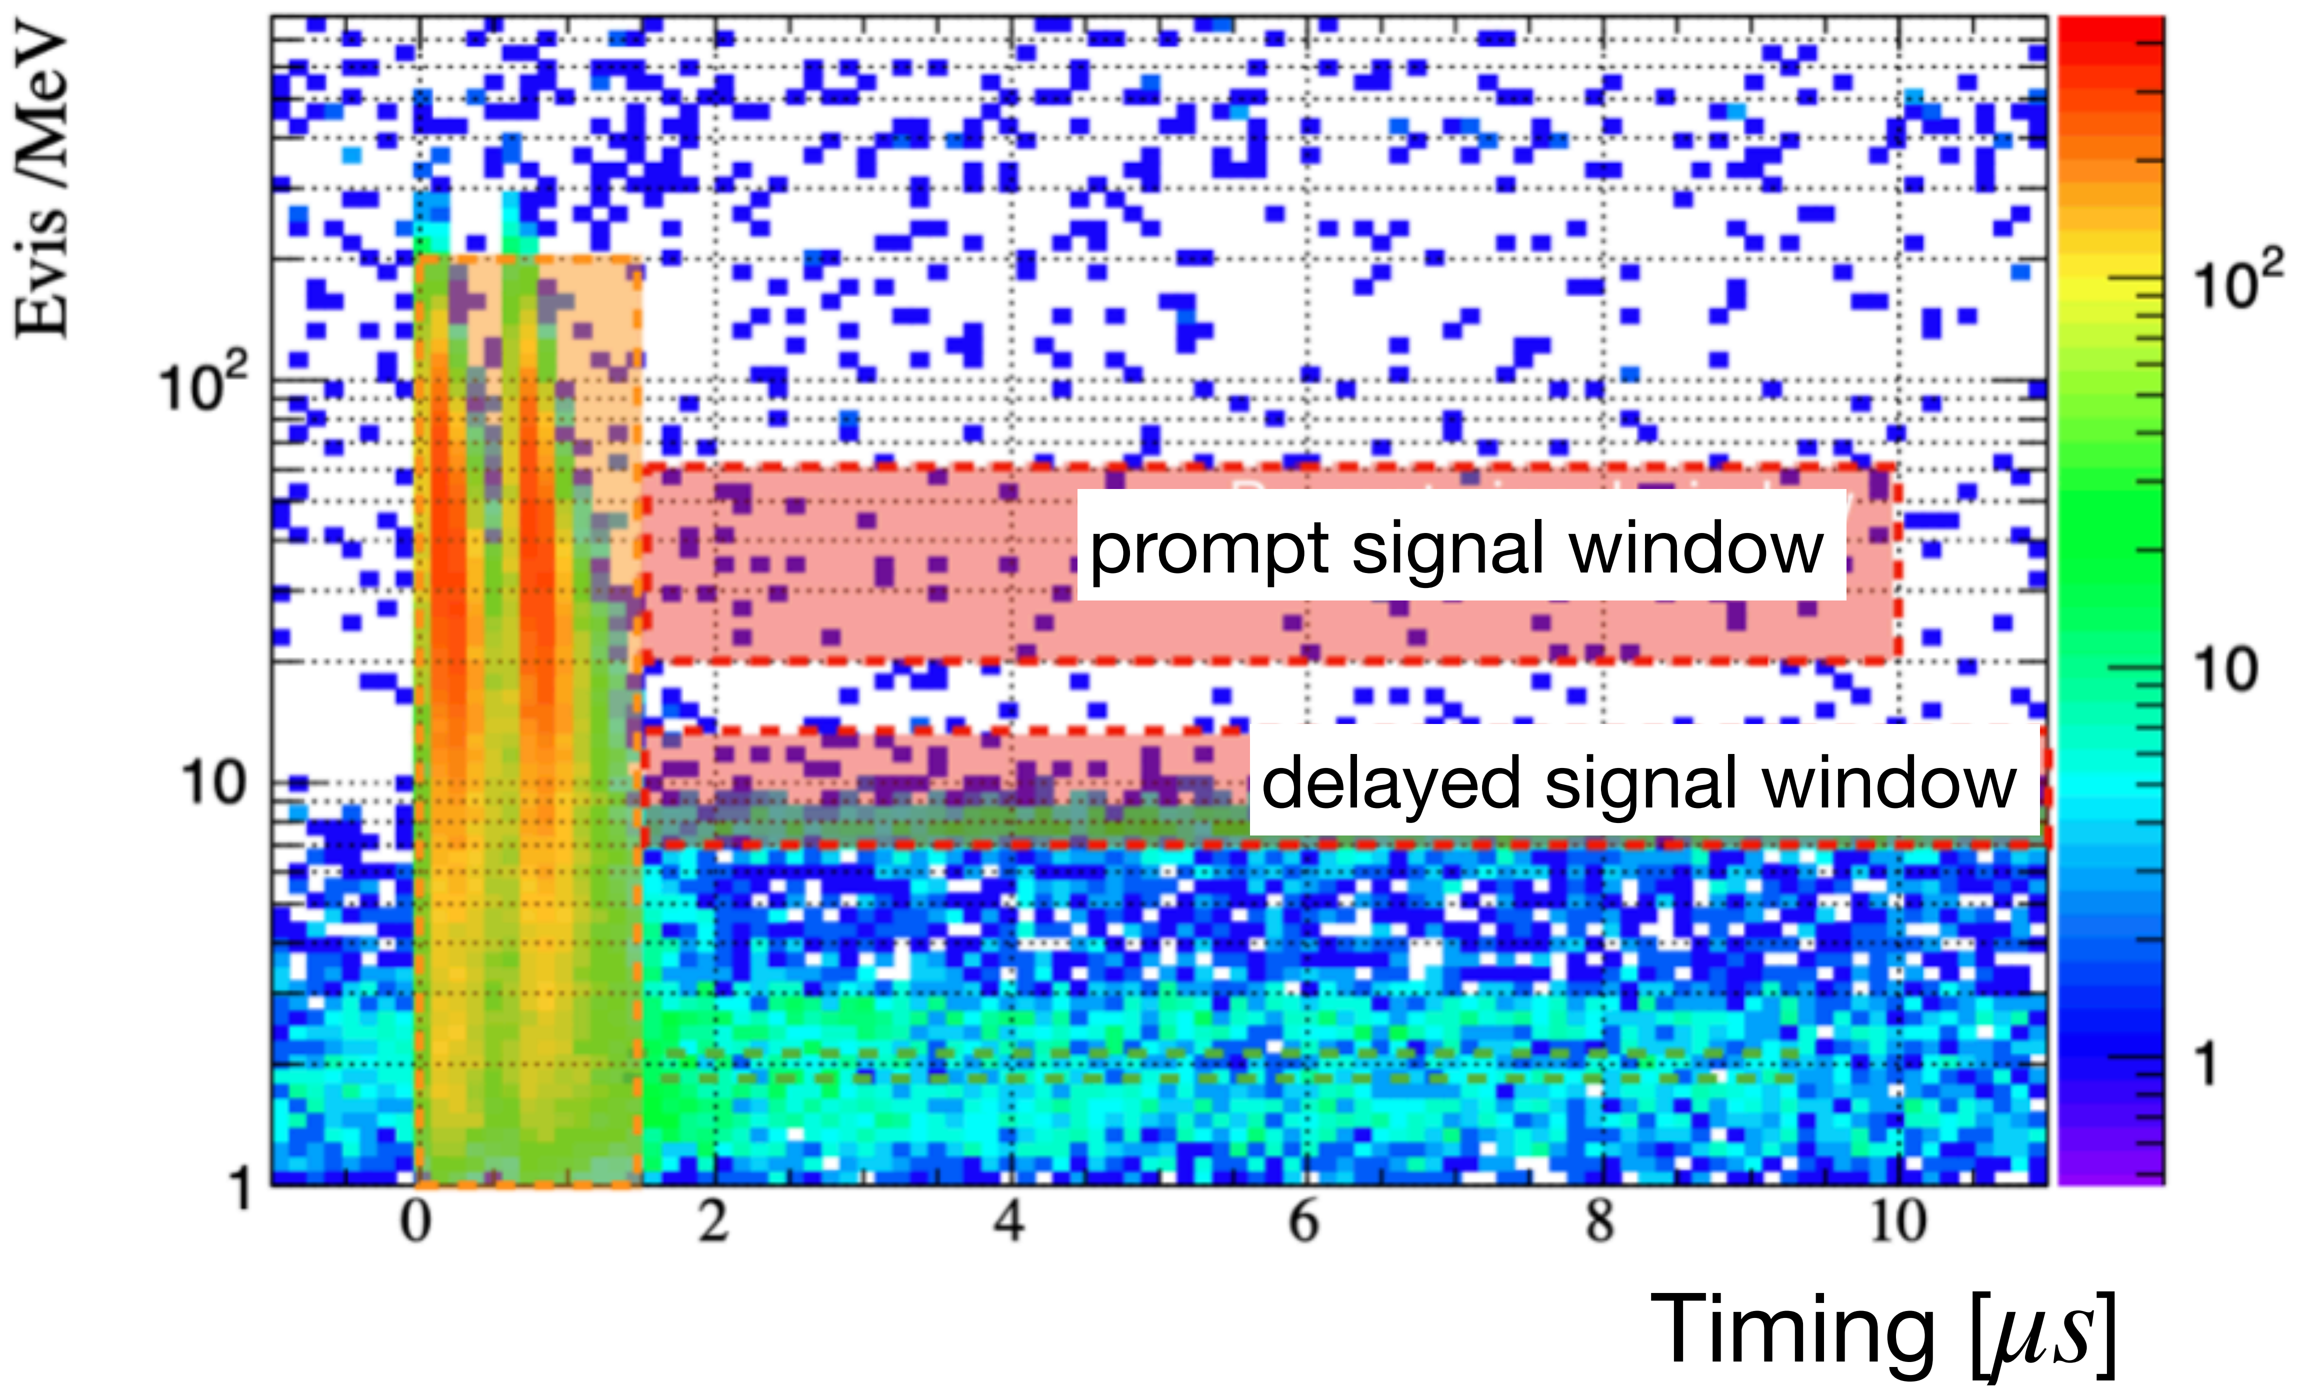


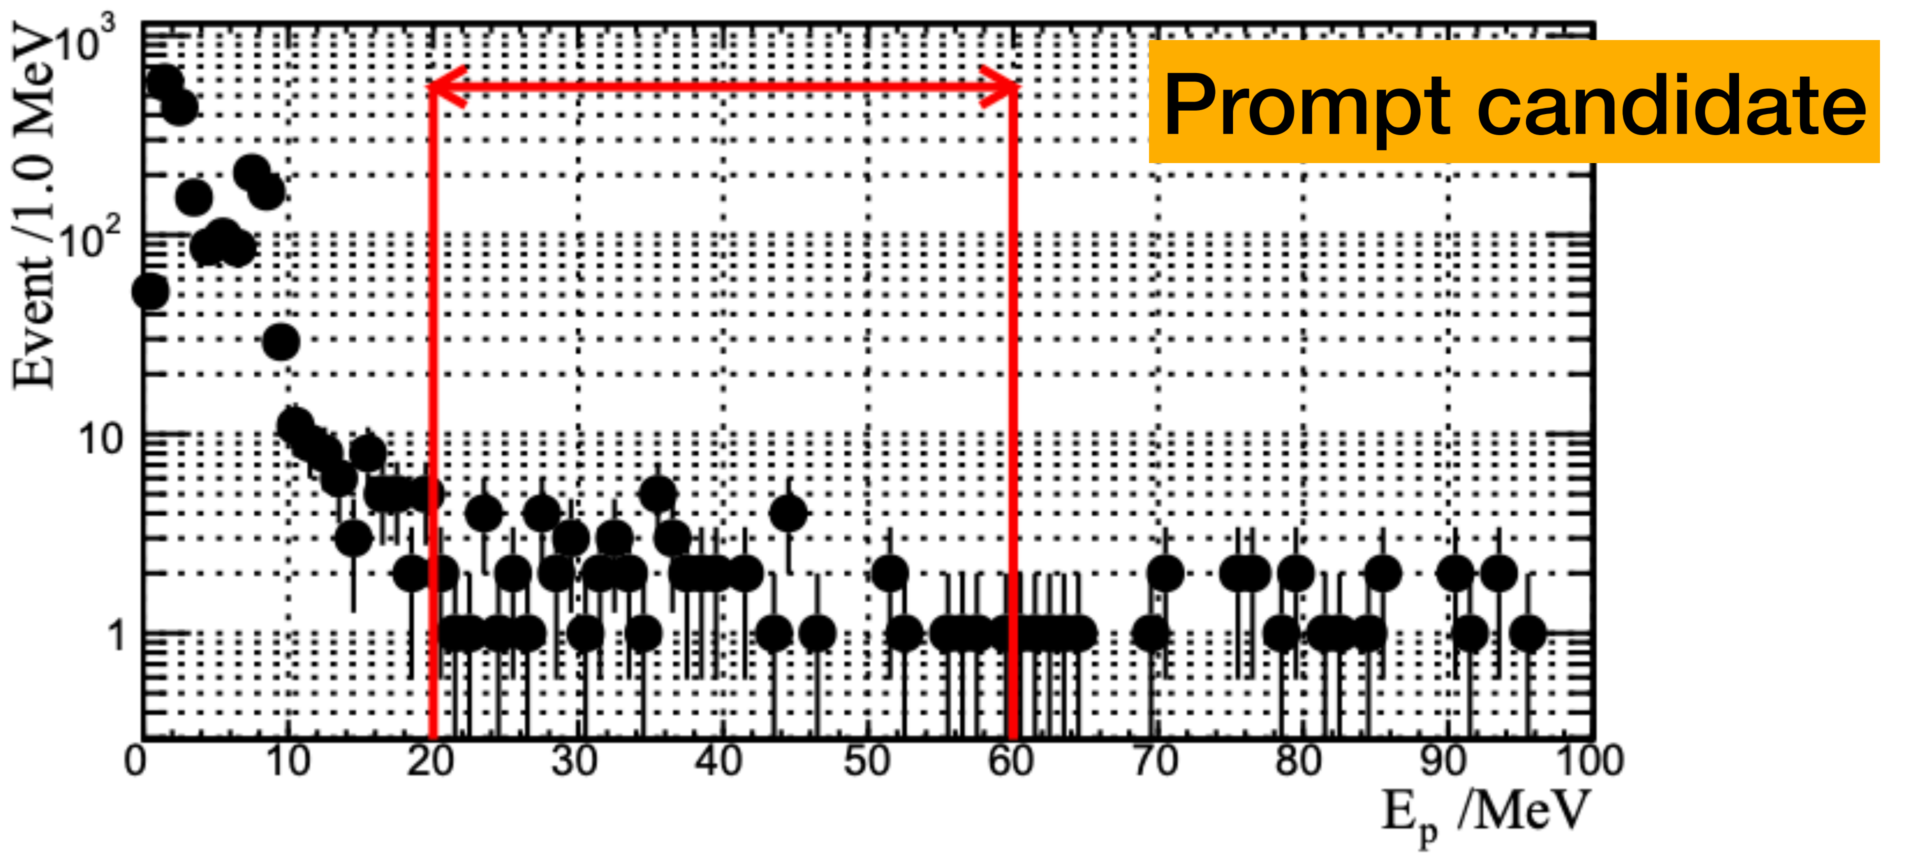


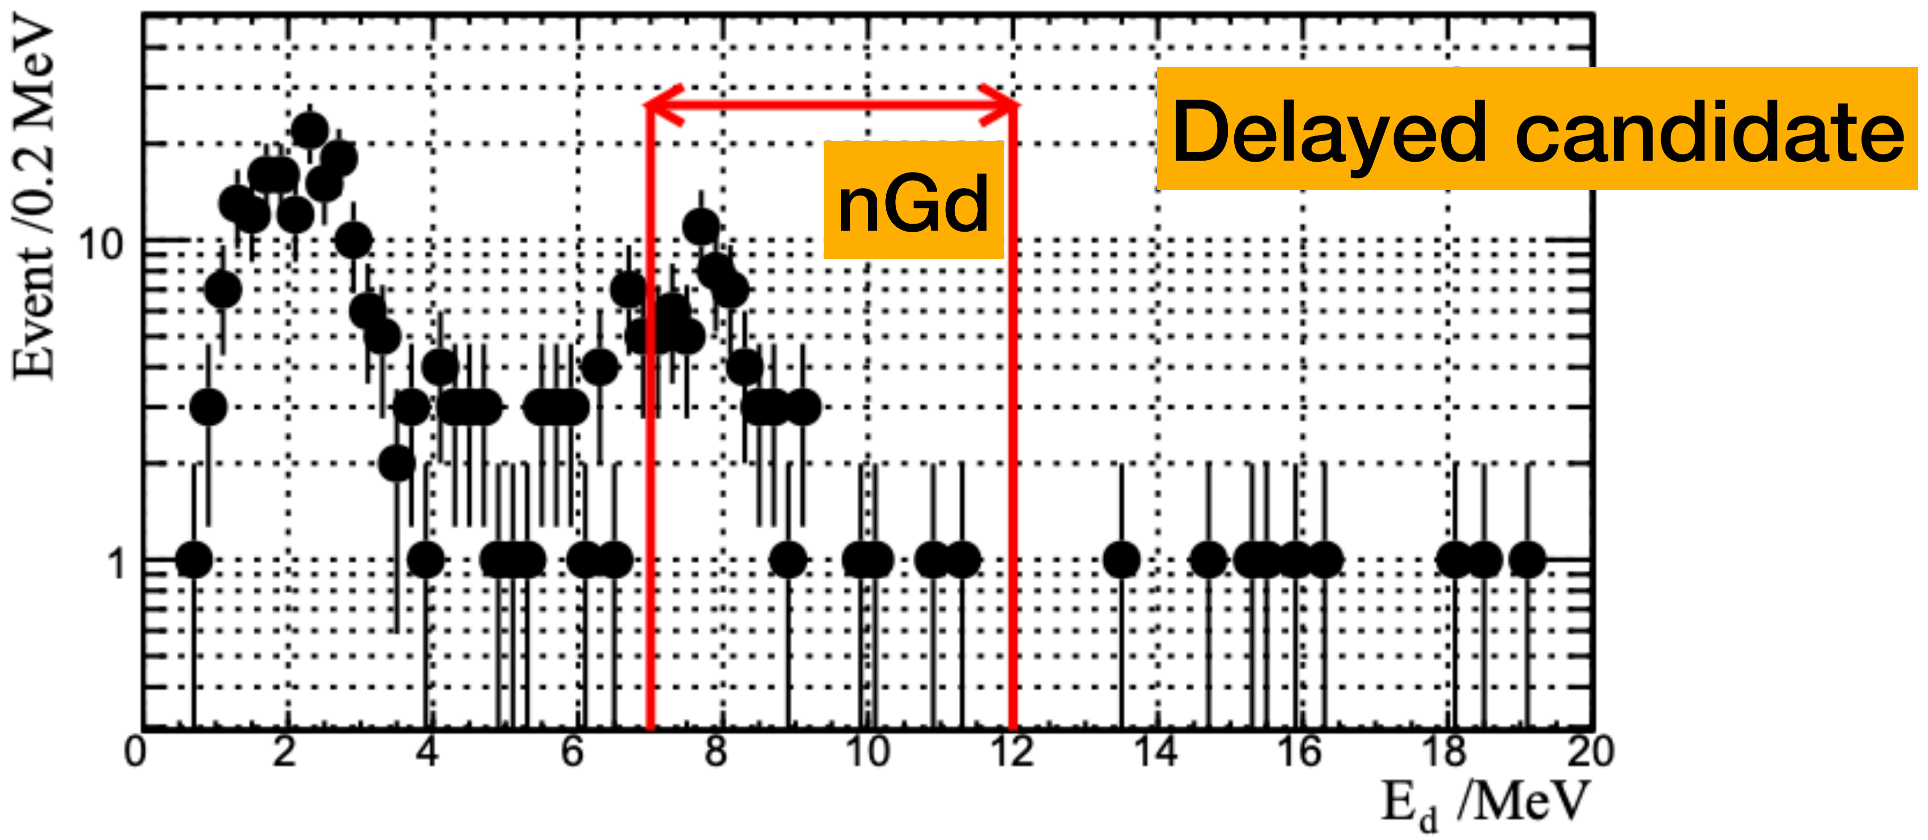
Commissioning run

(Eur. Phys. J. C (2022) 82:331)

- June/5-15, 2020
- Integrated POT: 8.9×10^{20}
- Beam trigger with 25 μs width







Observed correlated event candidates

- 59 ± 8 events / 8 M spills
- **Cosmic-induced fast neutrons** are the dominant background
  - **Correlated background:** 55.9 ± 4.3
  - **Pulse shape discrimination (PSD) would reject them**.
  - Two independent groups are working on it.

Analysis using 2021 data set

Pulse Shape Discrimination (PSD)

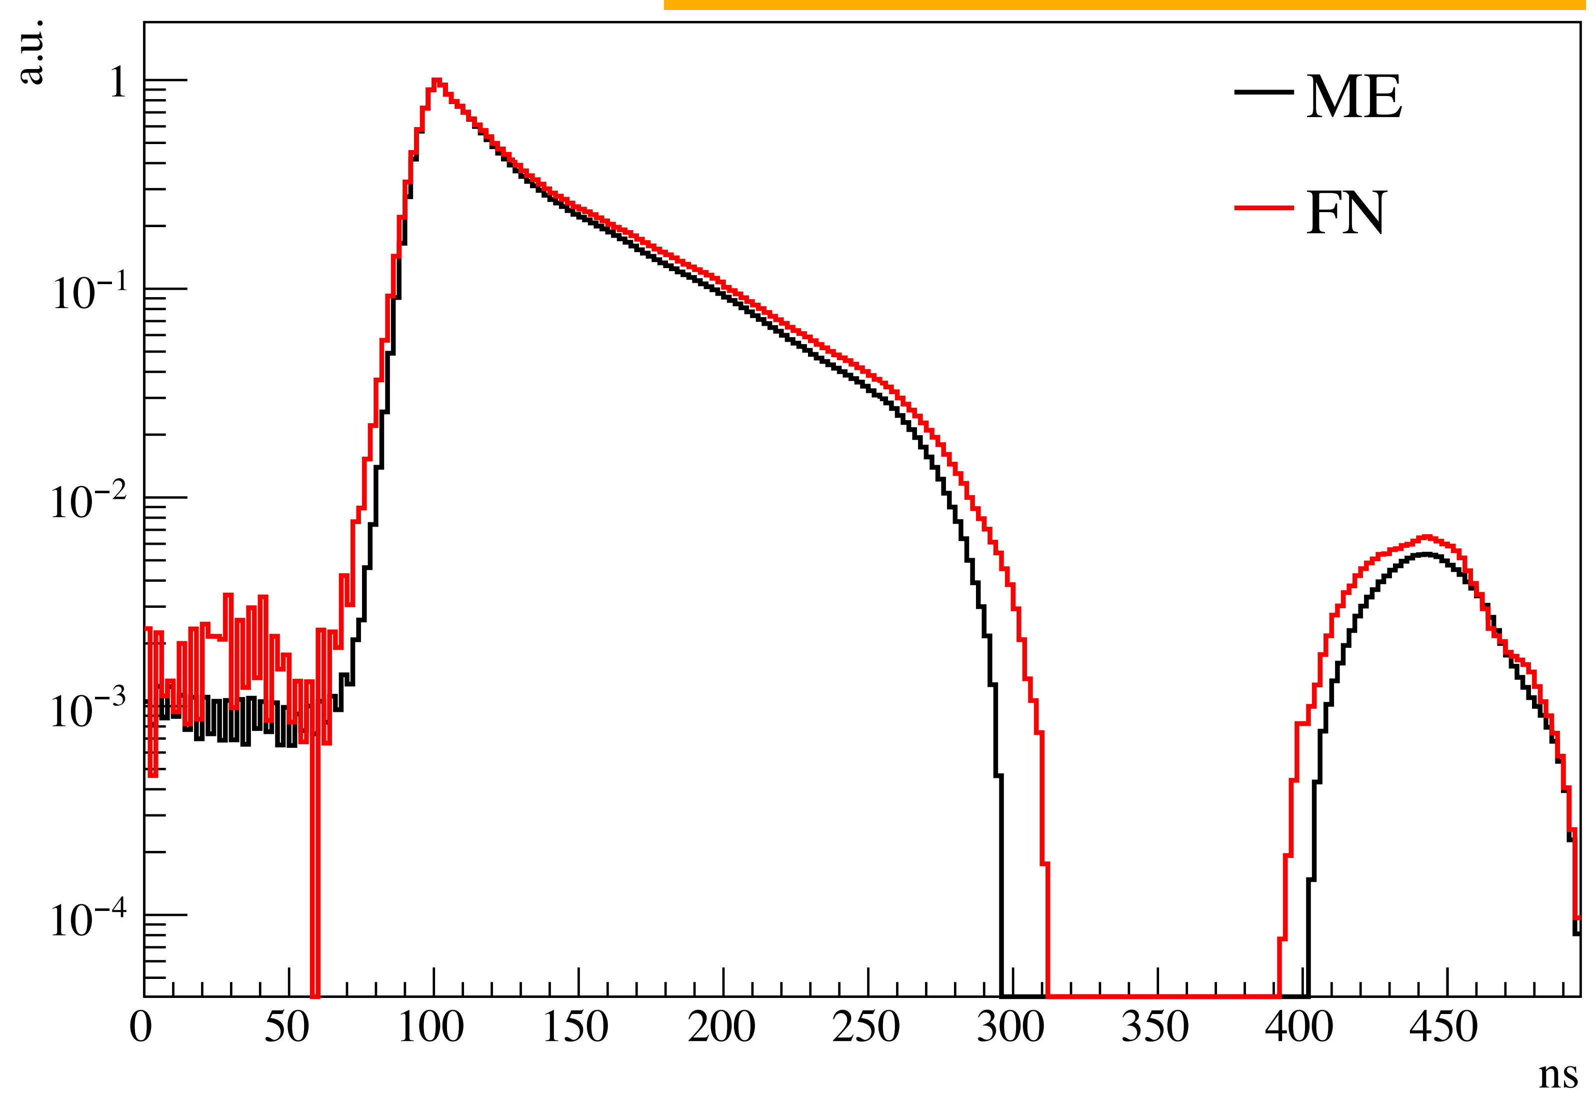
(2-dimensional likelihood method)

- It has been developed **based on the real data of JSNS[2]**.
- **10% DIN** (2000 L) has been added for improving the PSD power.
- Based on the charge ratio of each FADC bin (208 bins in total) divided by the peak of each waveform.
- **Using control samples of Michel electrons (ME) and Fast neutrons (FN)**
- PSD evaluation score: $\sum_{PMT} Q_{PMT}^{total}[ln(L_{ME}) - ln(L_{FN})]$

  where $L = \prod_{bin} [P_{bin}(Q_{ratio})],\ Q_{ratio} = Q_{bin}/Q_{peak}$

- Note that there are two types of ME for considering afterpulse.

Example of waveforms

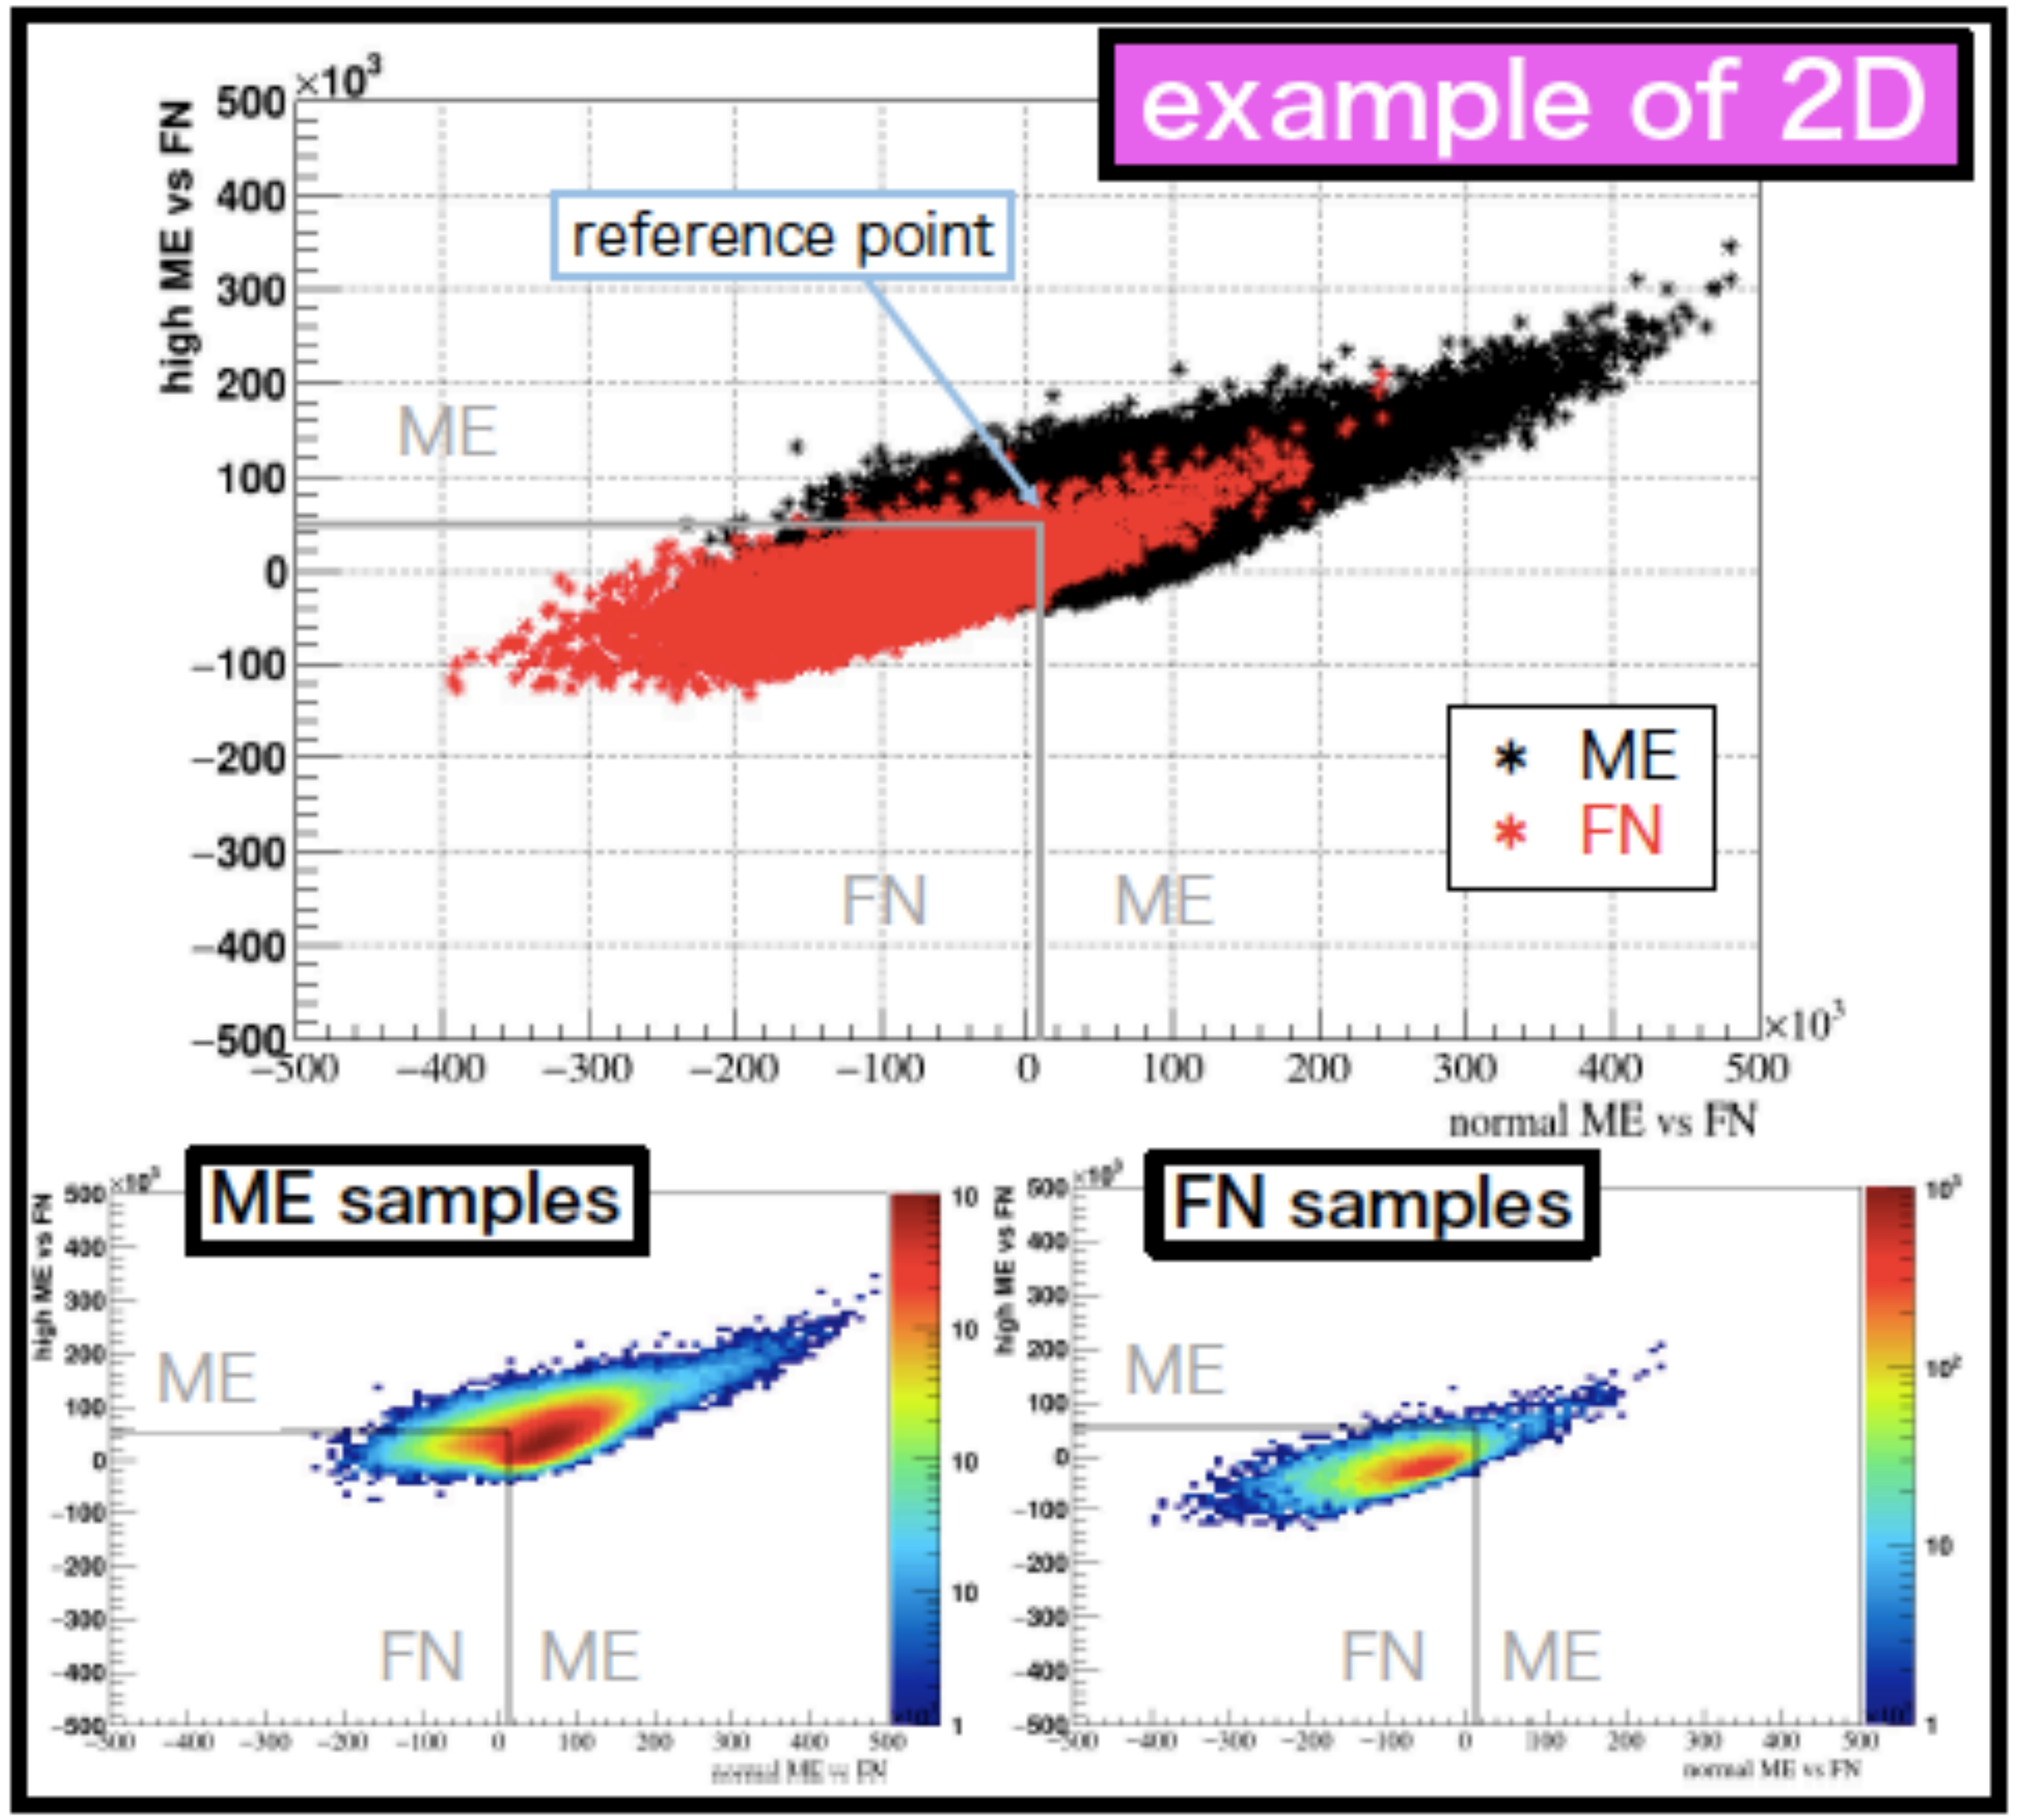


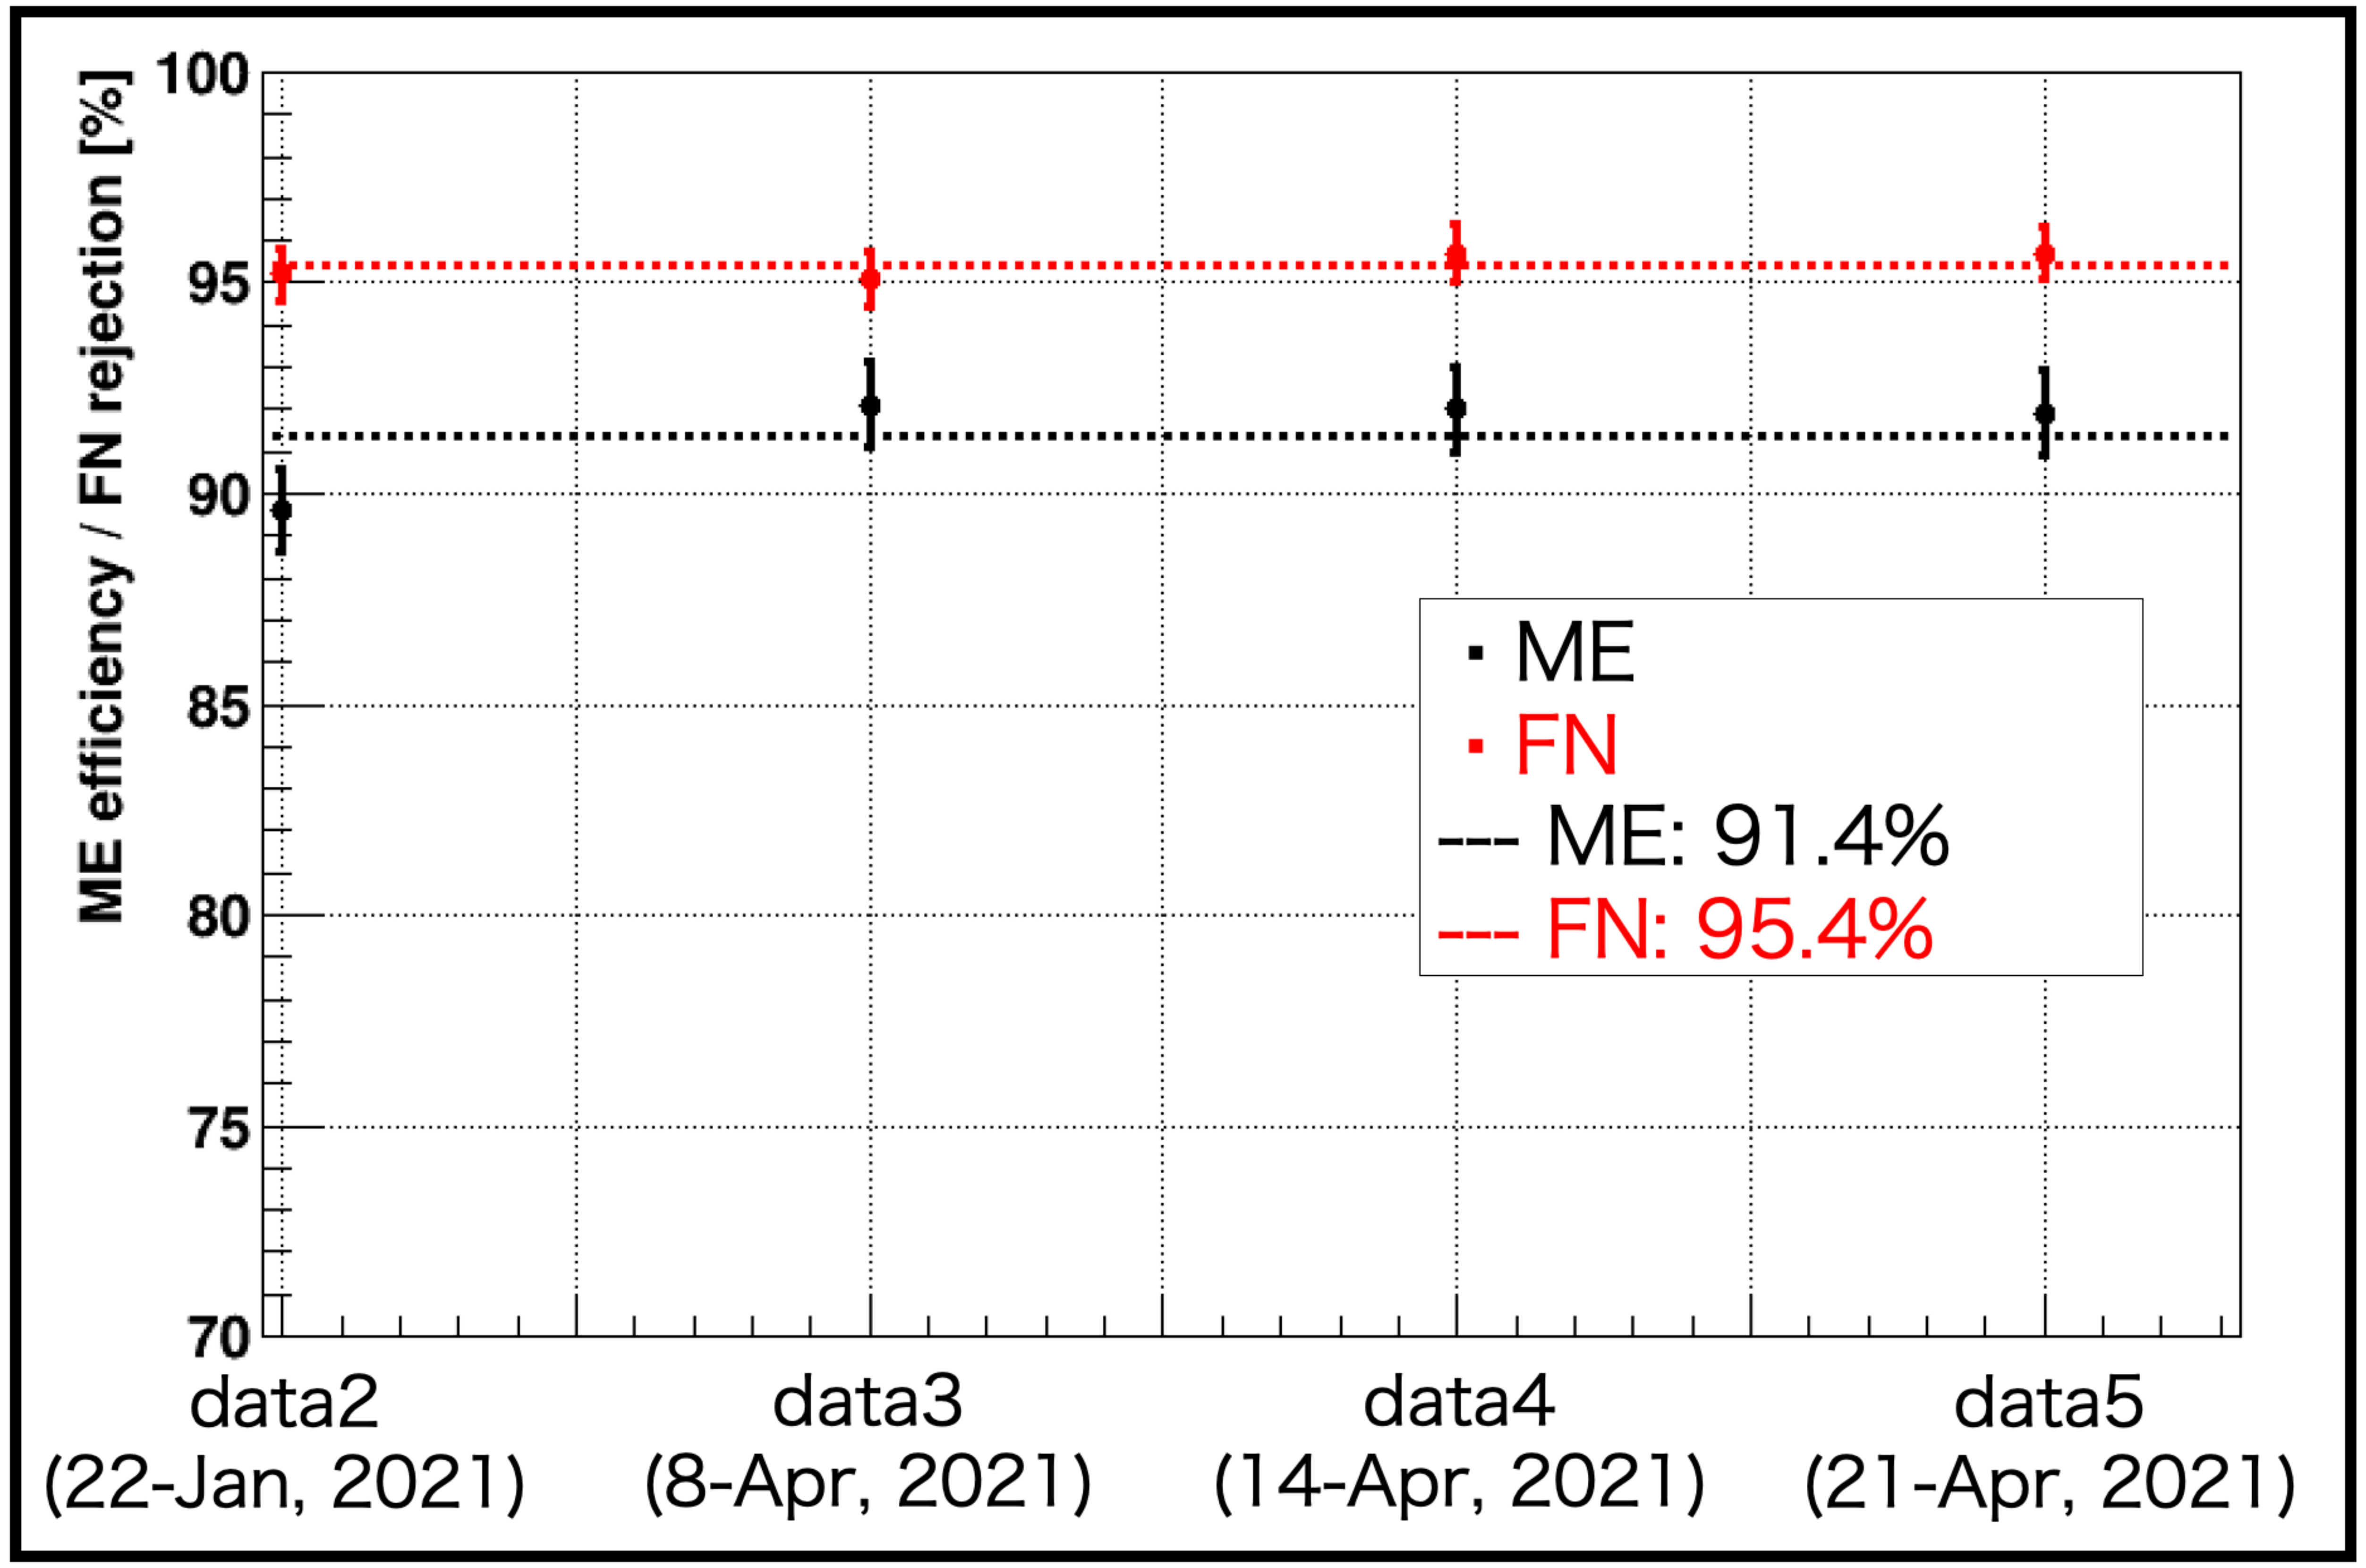
Pulse Shape Discrimination (PSD)

(2-dimensional likelihood method)

ME efficiency: 91.4 ± 0.5 %

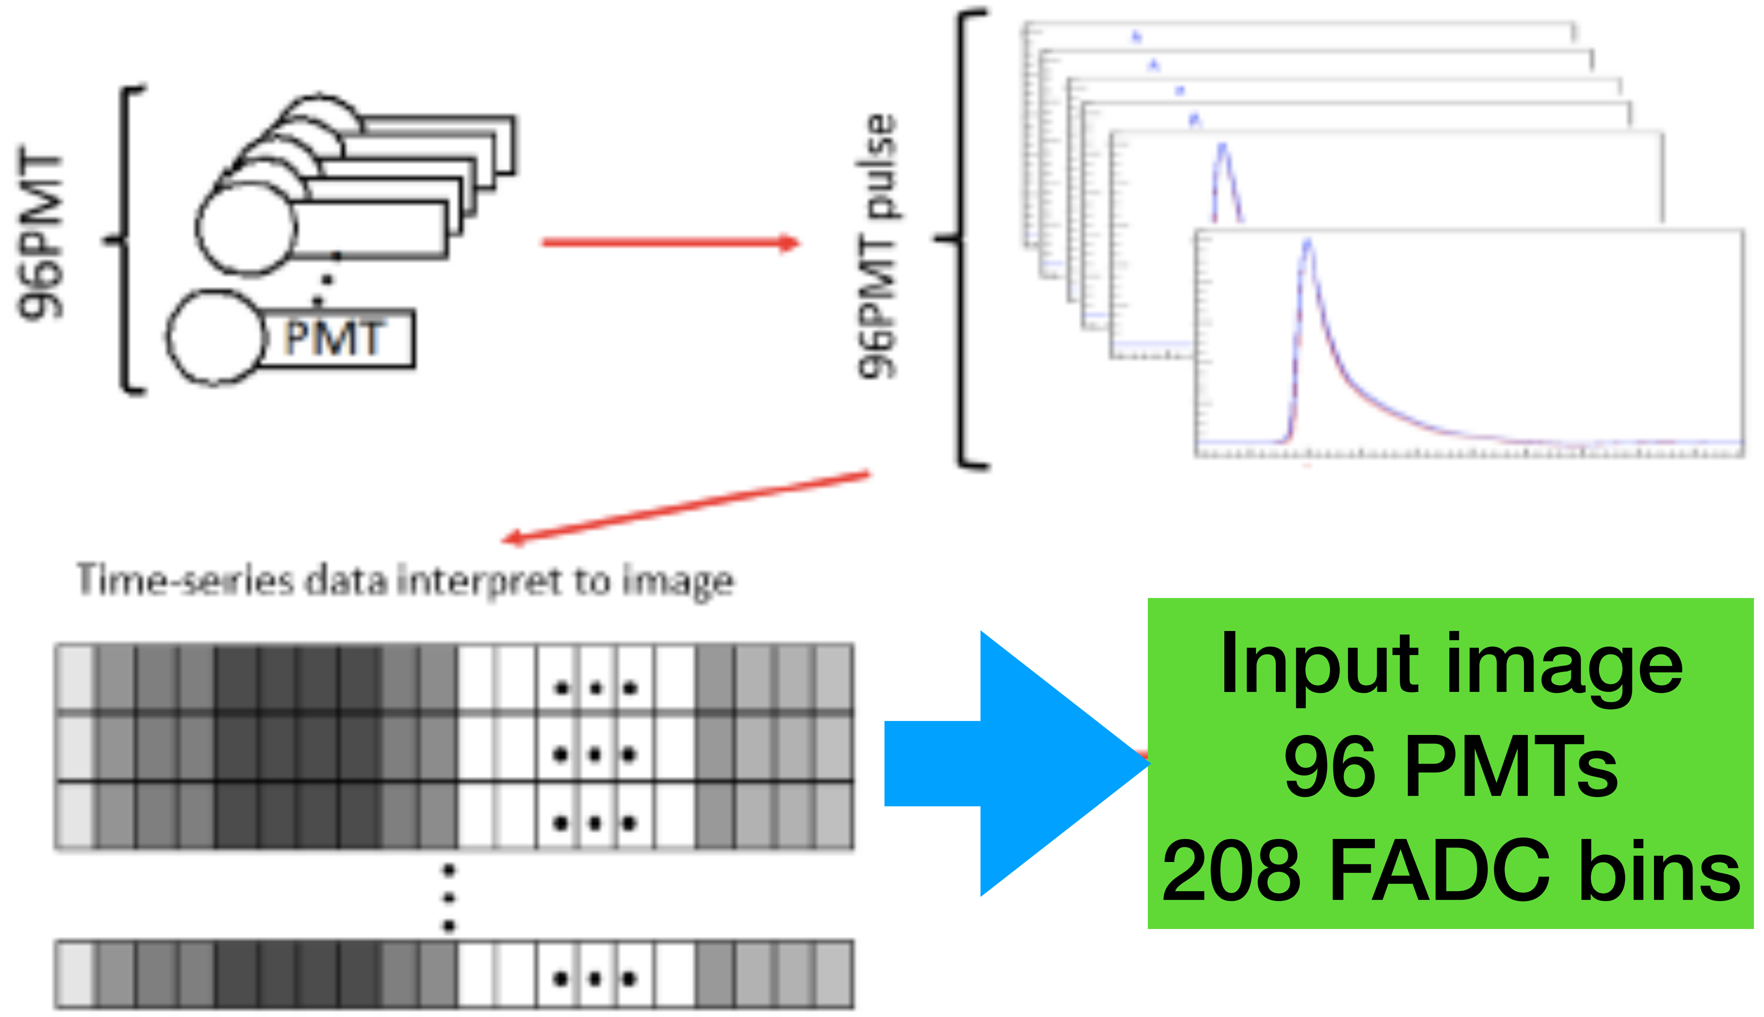
FN rejection: 95.4 ± 0.3 %



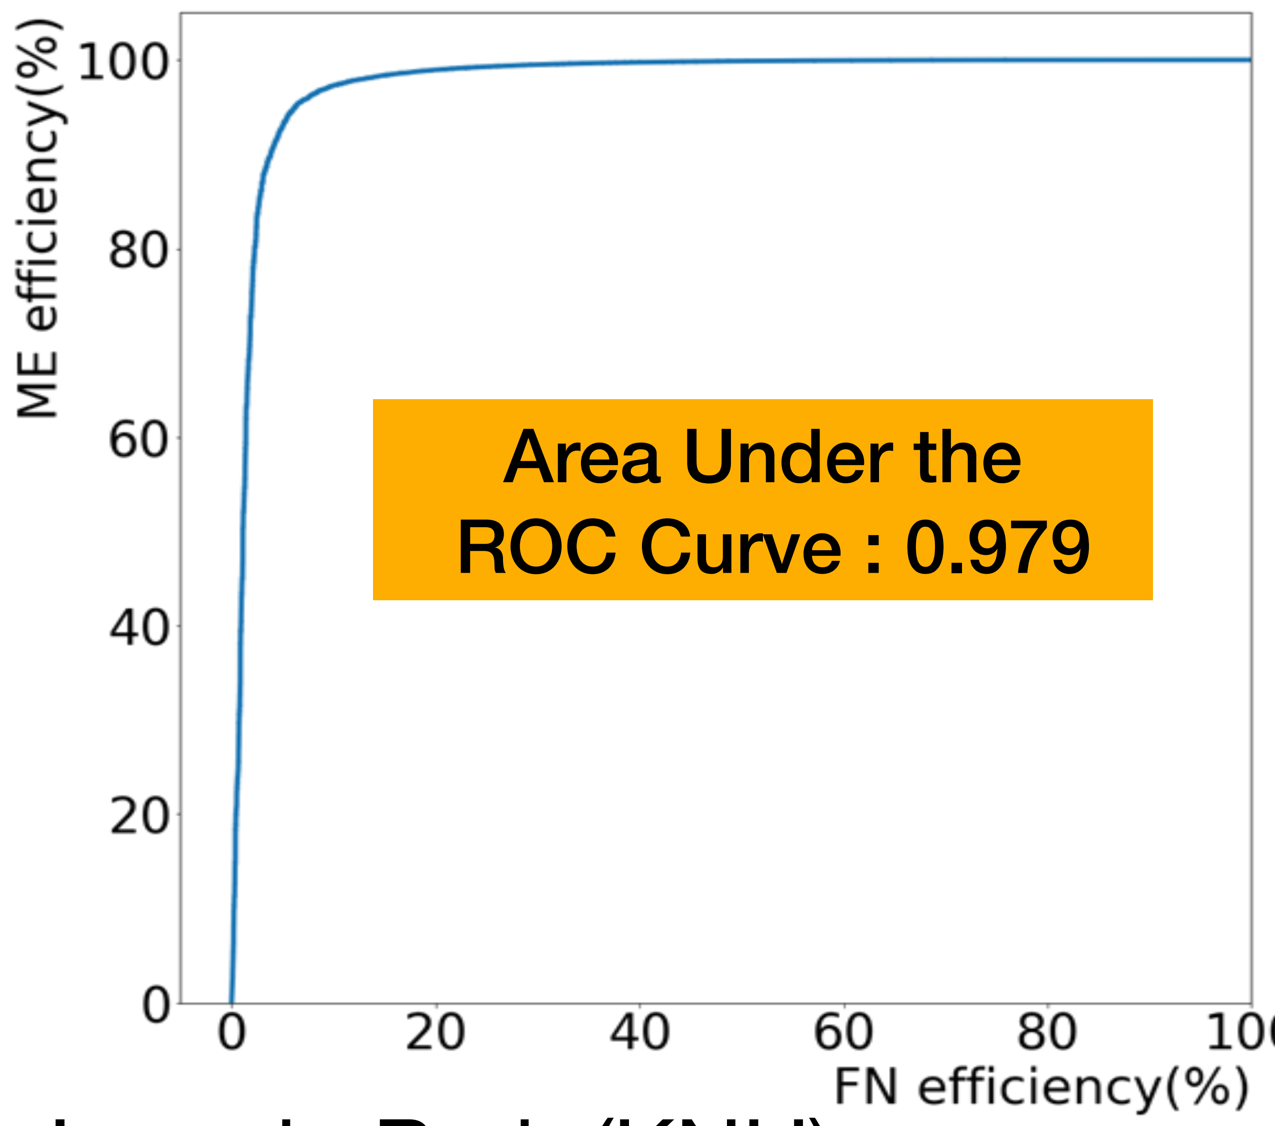


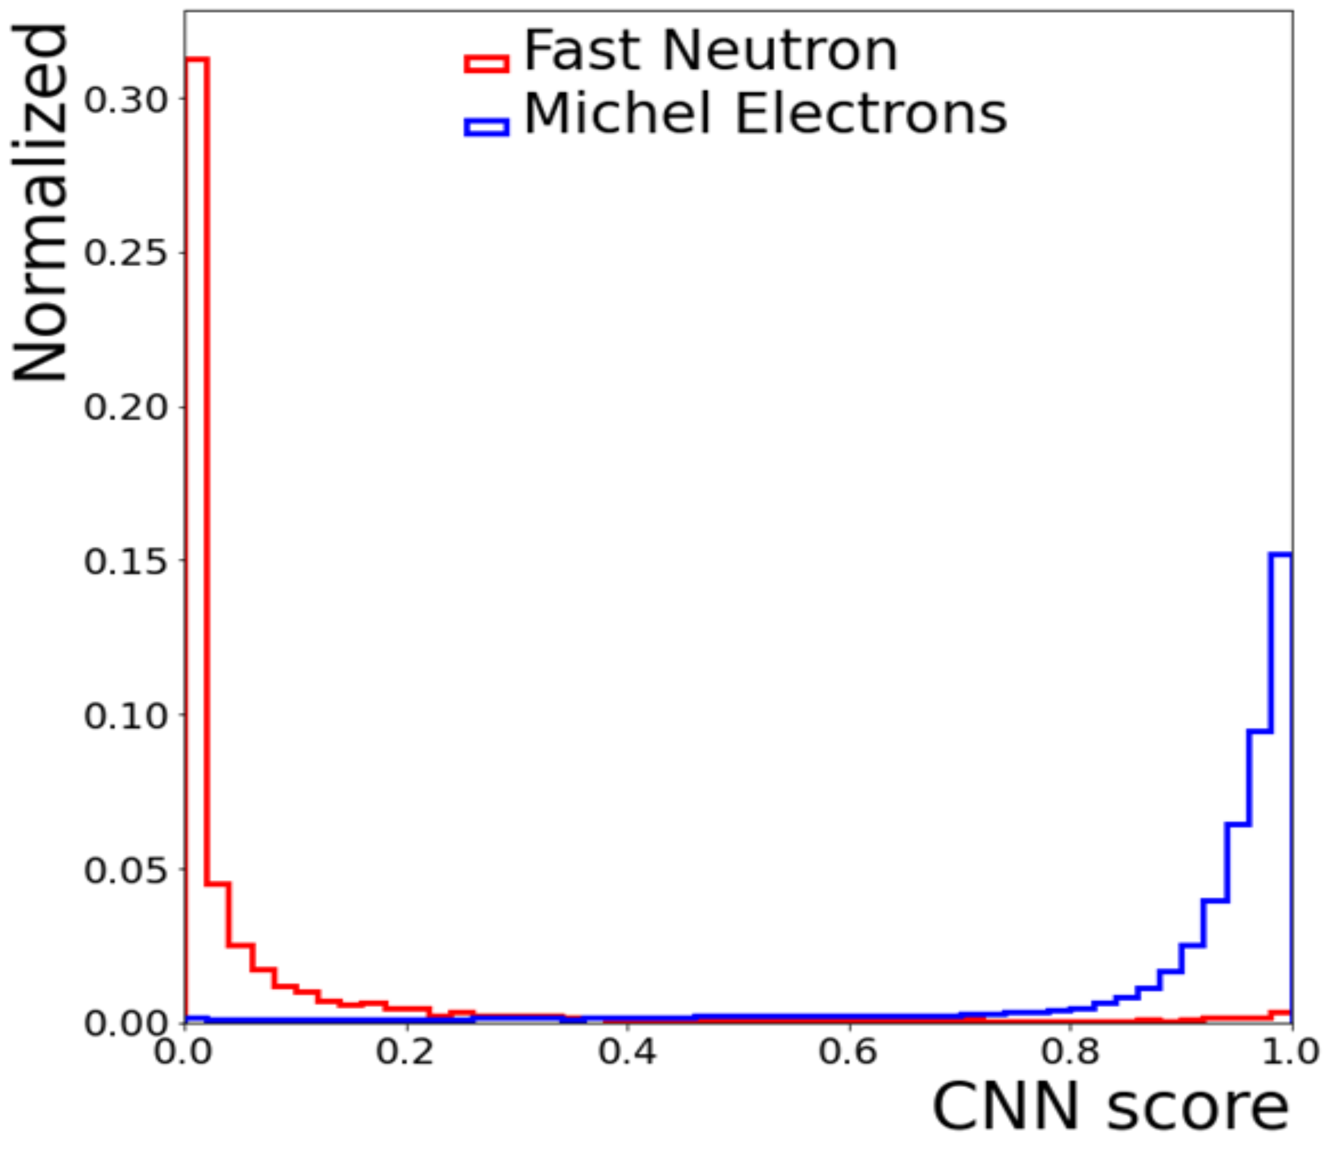
Pulse Shape Discrimination (PSD)

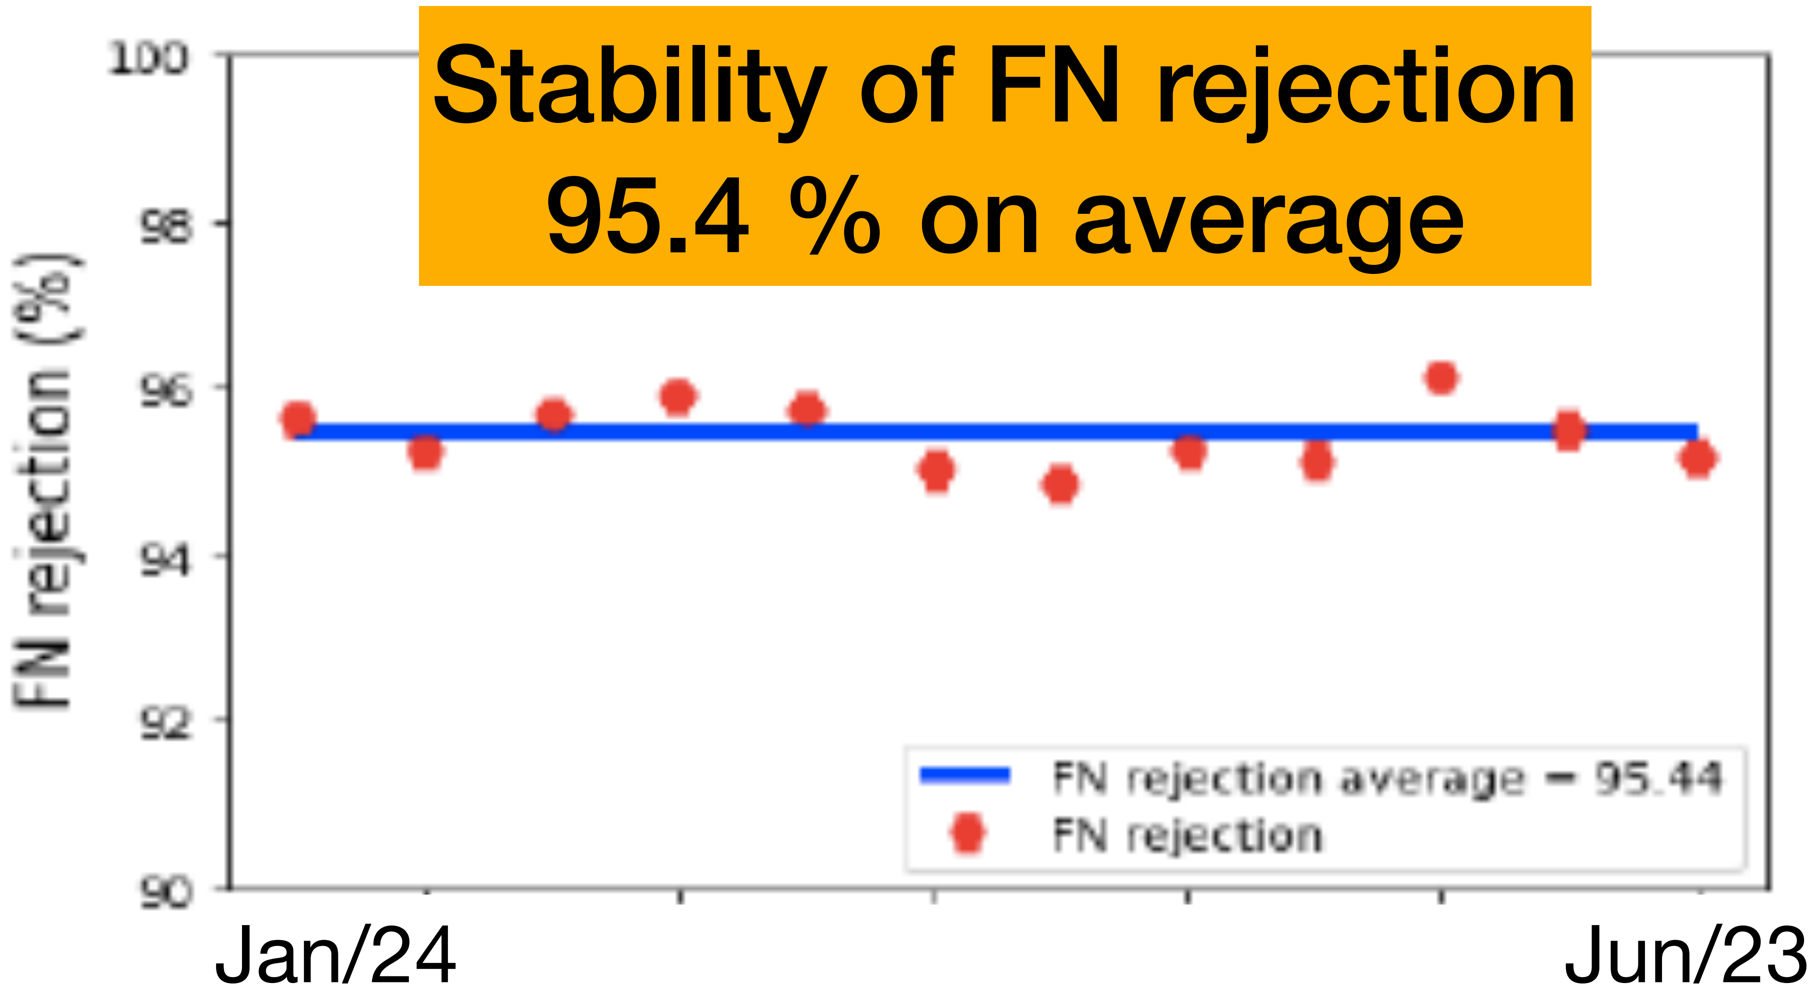
(Convolutional Neural Network, CNN)



- **Treated time-series data from a PMT with image data**
- Data: Training (37.5%), validation (12,5%) and evaluation (50 %)
- **Two independent efforts show consistent FN-rejection result**







Jungsic Park (KNU)

Roadmap

(sterile neutrino search)

Estimation of the background → **Blind analysis** → **Sensitivity**

JSNS^2 is here

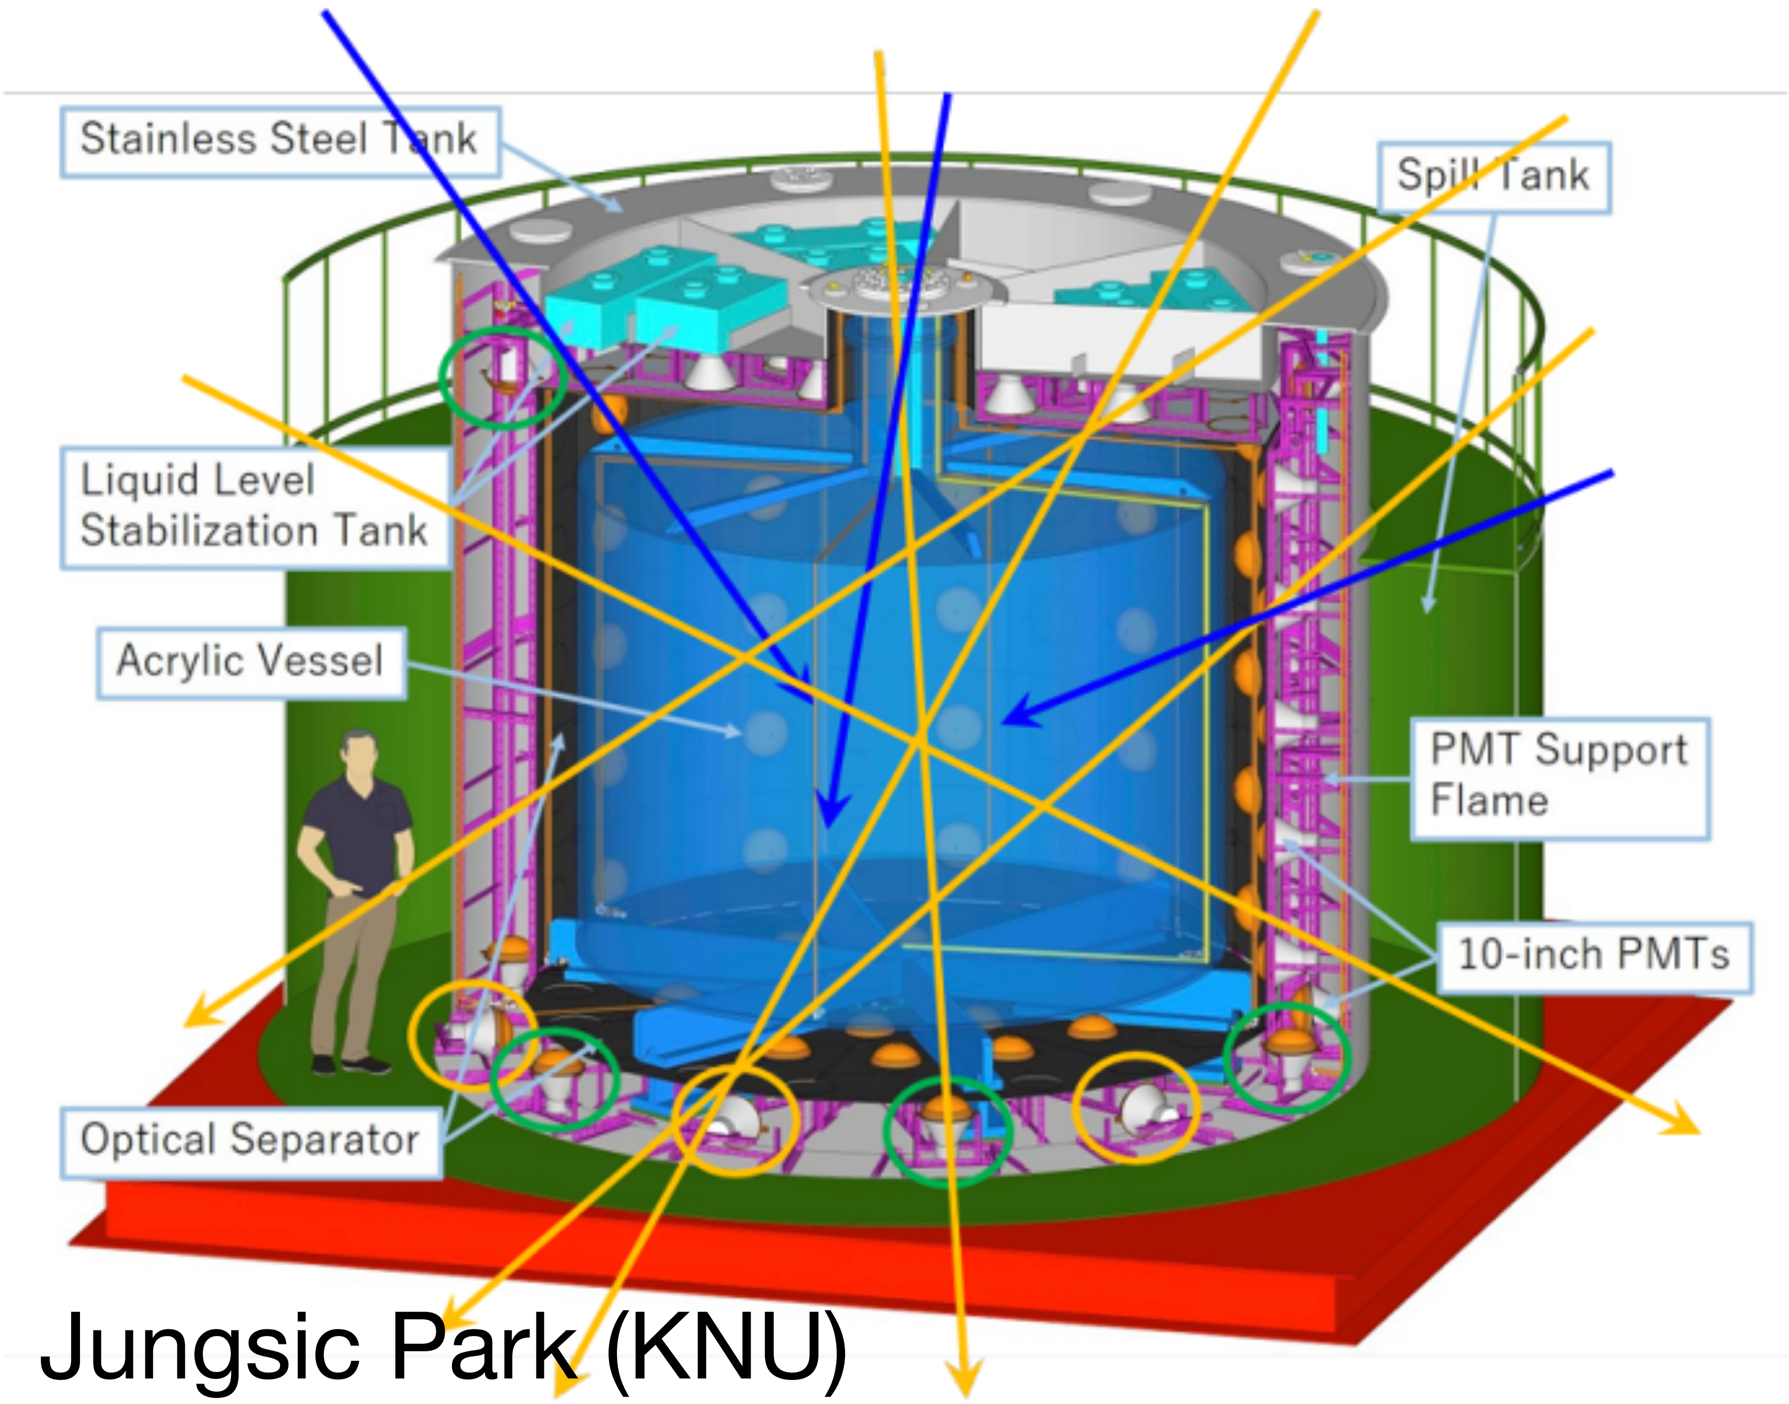
- Reduction
- Event selection
- **Compare single rate with TDR**
- Coincidence
  - Energy and timing
  - Delta vertex
  - Fiducial
  - More sophisticated method

- Energy side-bands (and timing side-band)
- **Consistency check**
- self-trigger / beam trigger
- PSD
- More sophisticated method
- Toward a signal region

- Uncertainties
  - Flux
  - Energy scale
  - Others

Cosmic muon identification

- Michel electron induced by cosmic muon and muon itself are one of the backgrounds.
- Tag muons passing through the detector & stopping at the detector using veto information.



JSNS^2 equips 24 Veto PMTs

- 12 PMTs on top / 12 PMTs on bottom
- 6 PMTs among 12 face radial direction
- Other half face vertical direction

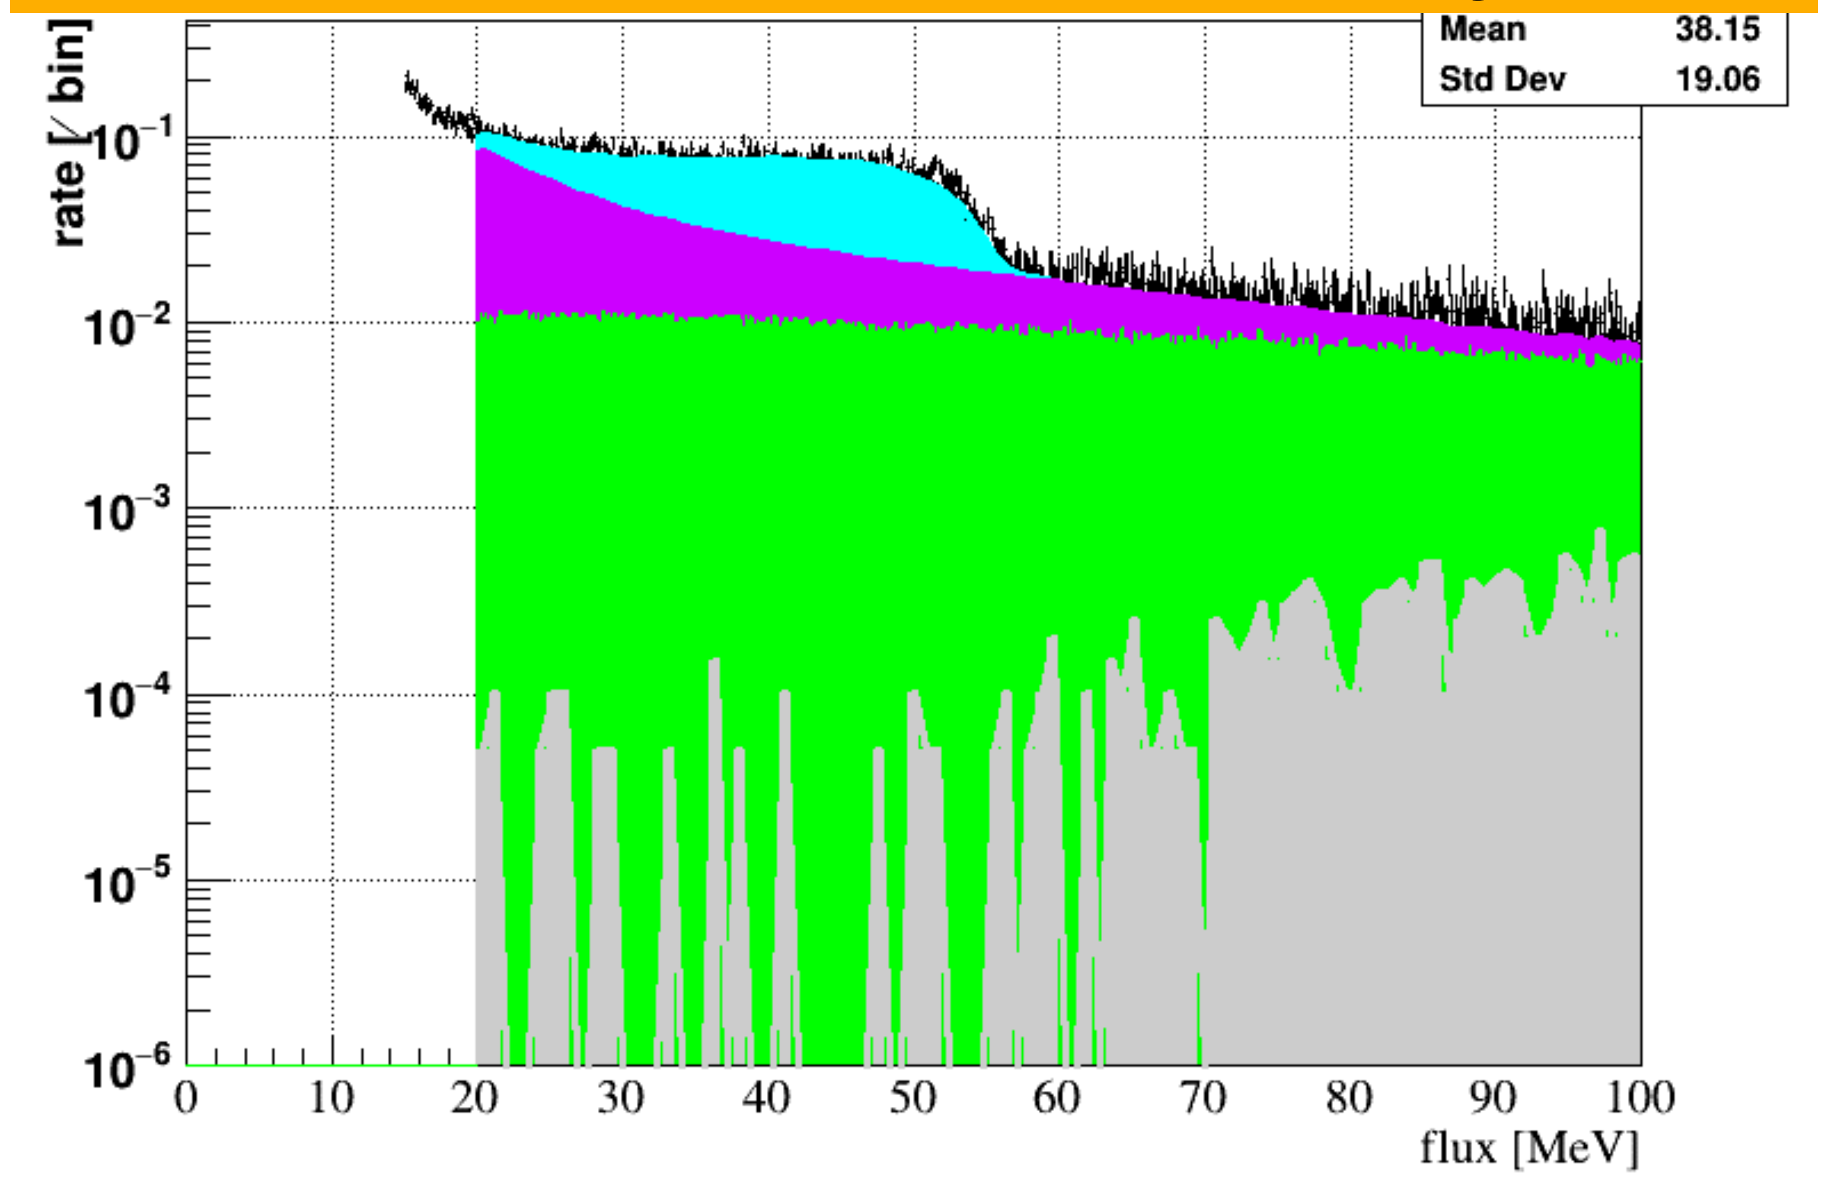
- Muon candidate rate [Hz]: 1487.8 ± 0.6
- Michel candidate rate [Hz]: 110.1 ± 0.2 ($>$ 10 MeV)

Single rate of the sterile prompt

(Background estimation effort)

- External particle rejection with Veto PMTs
- **ME rejection: 10 μs vetoing after a stopping-muon**
- Fiducial cut
- Decomposition have been performed
  - To estimate each component
  - correlated / accidental
  - **Spectrum is obtained from each control sample.**
- **Reference (JSNS² TDR):** 3.8×10^{-4} **per spill**

Prompt candidate after ME rejection



correlated, but PSD would reject it

IBD pairing (coincidence) would highly suppress them

component	rate [Hz]
cosmic fast neutron (green)	3.9±0.7
michel electron (cyan)	13.3±0.3
cosmic gamma (violet)	9.3±0.6
stopping muon (gray)	0.01±0.02
total (black)	26.8±0.1
rate per spill	$(2.144\pm0.010)\times10^{-4}$

Toward the sterile neutrino search

(For the blind analysis)

- **Side-bands are defined by energies**

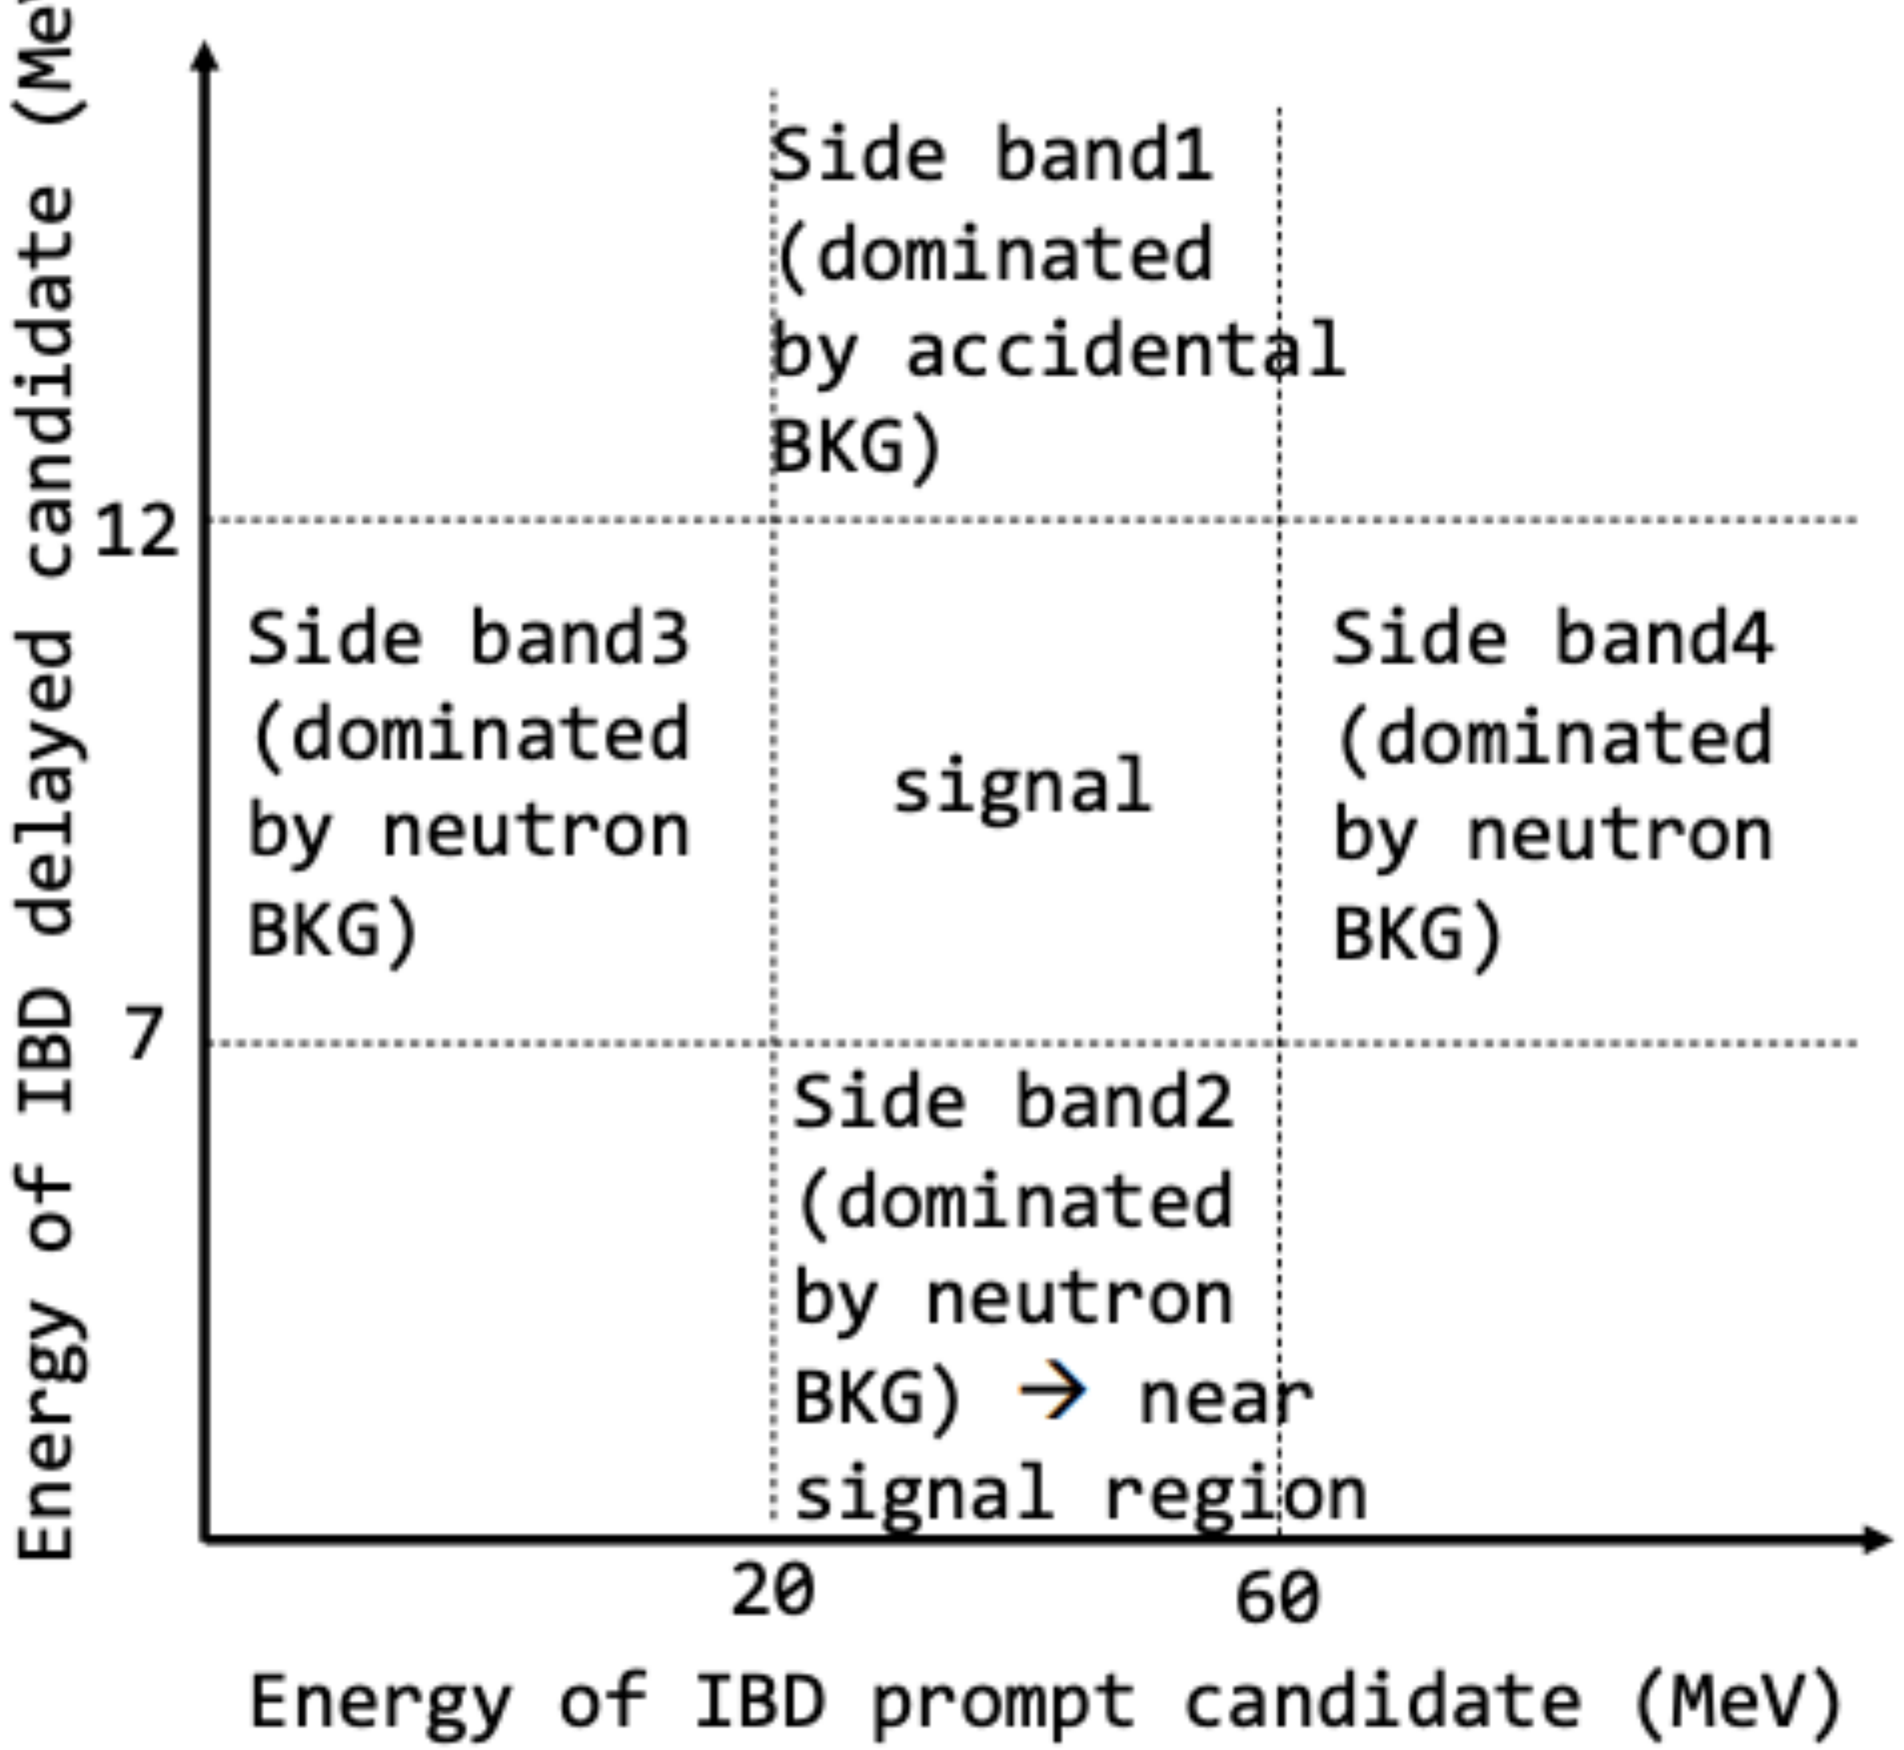
- The rates in the side-band regions can be predicted by other data
  - self-trigger: cosmic-induced neutron
  - beam-trigger: accidental

- After application of PSD, all of side-band regions will be accidental dominated.

- JSNS^2 has been studying each side-band

- All side-bands should be understood thoroughly before opening the signal region

energy side-bands



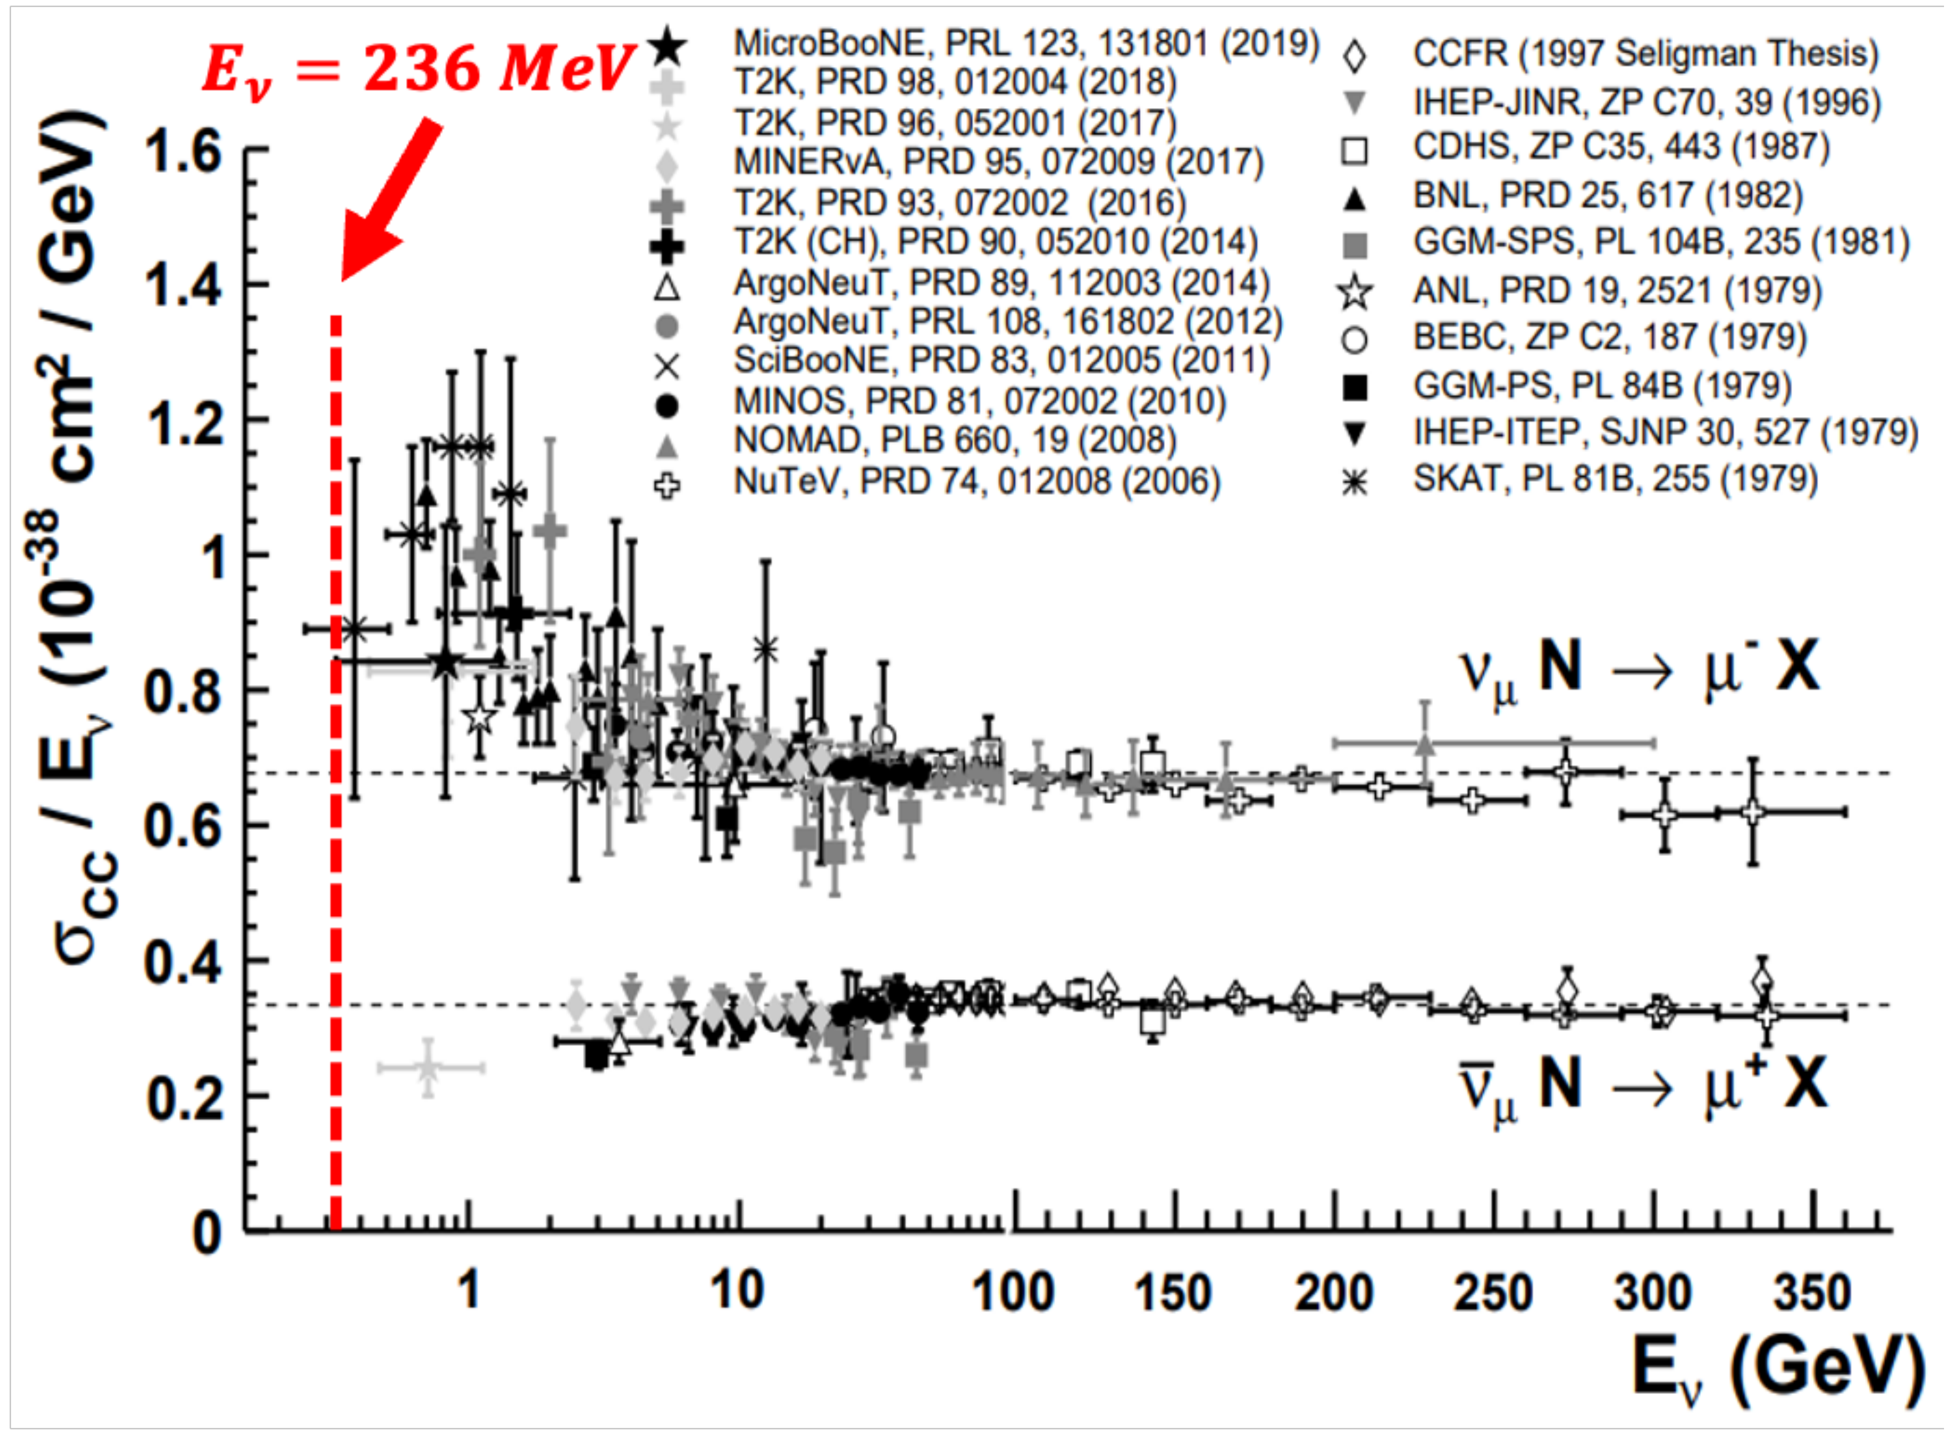
- WG 1, Thursday, 05:28 PM:
- “Status of the KDAR neutrino search with JSNS^2 experiment”

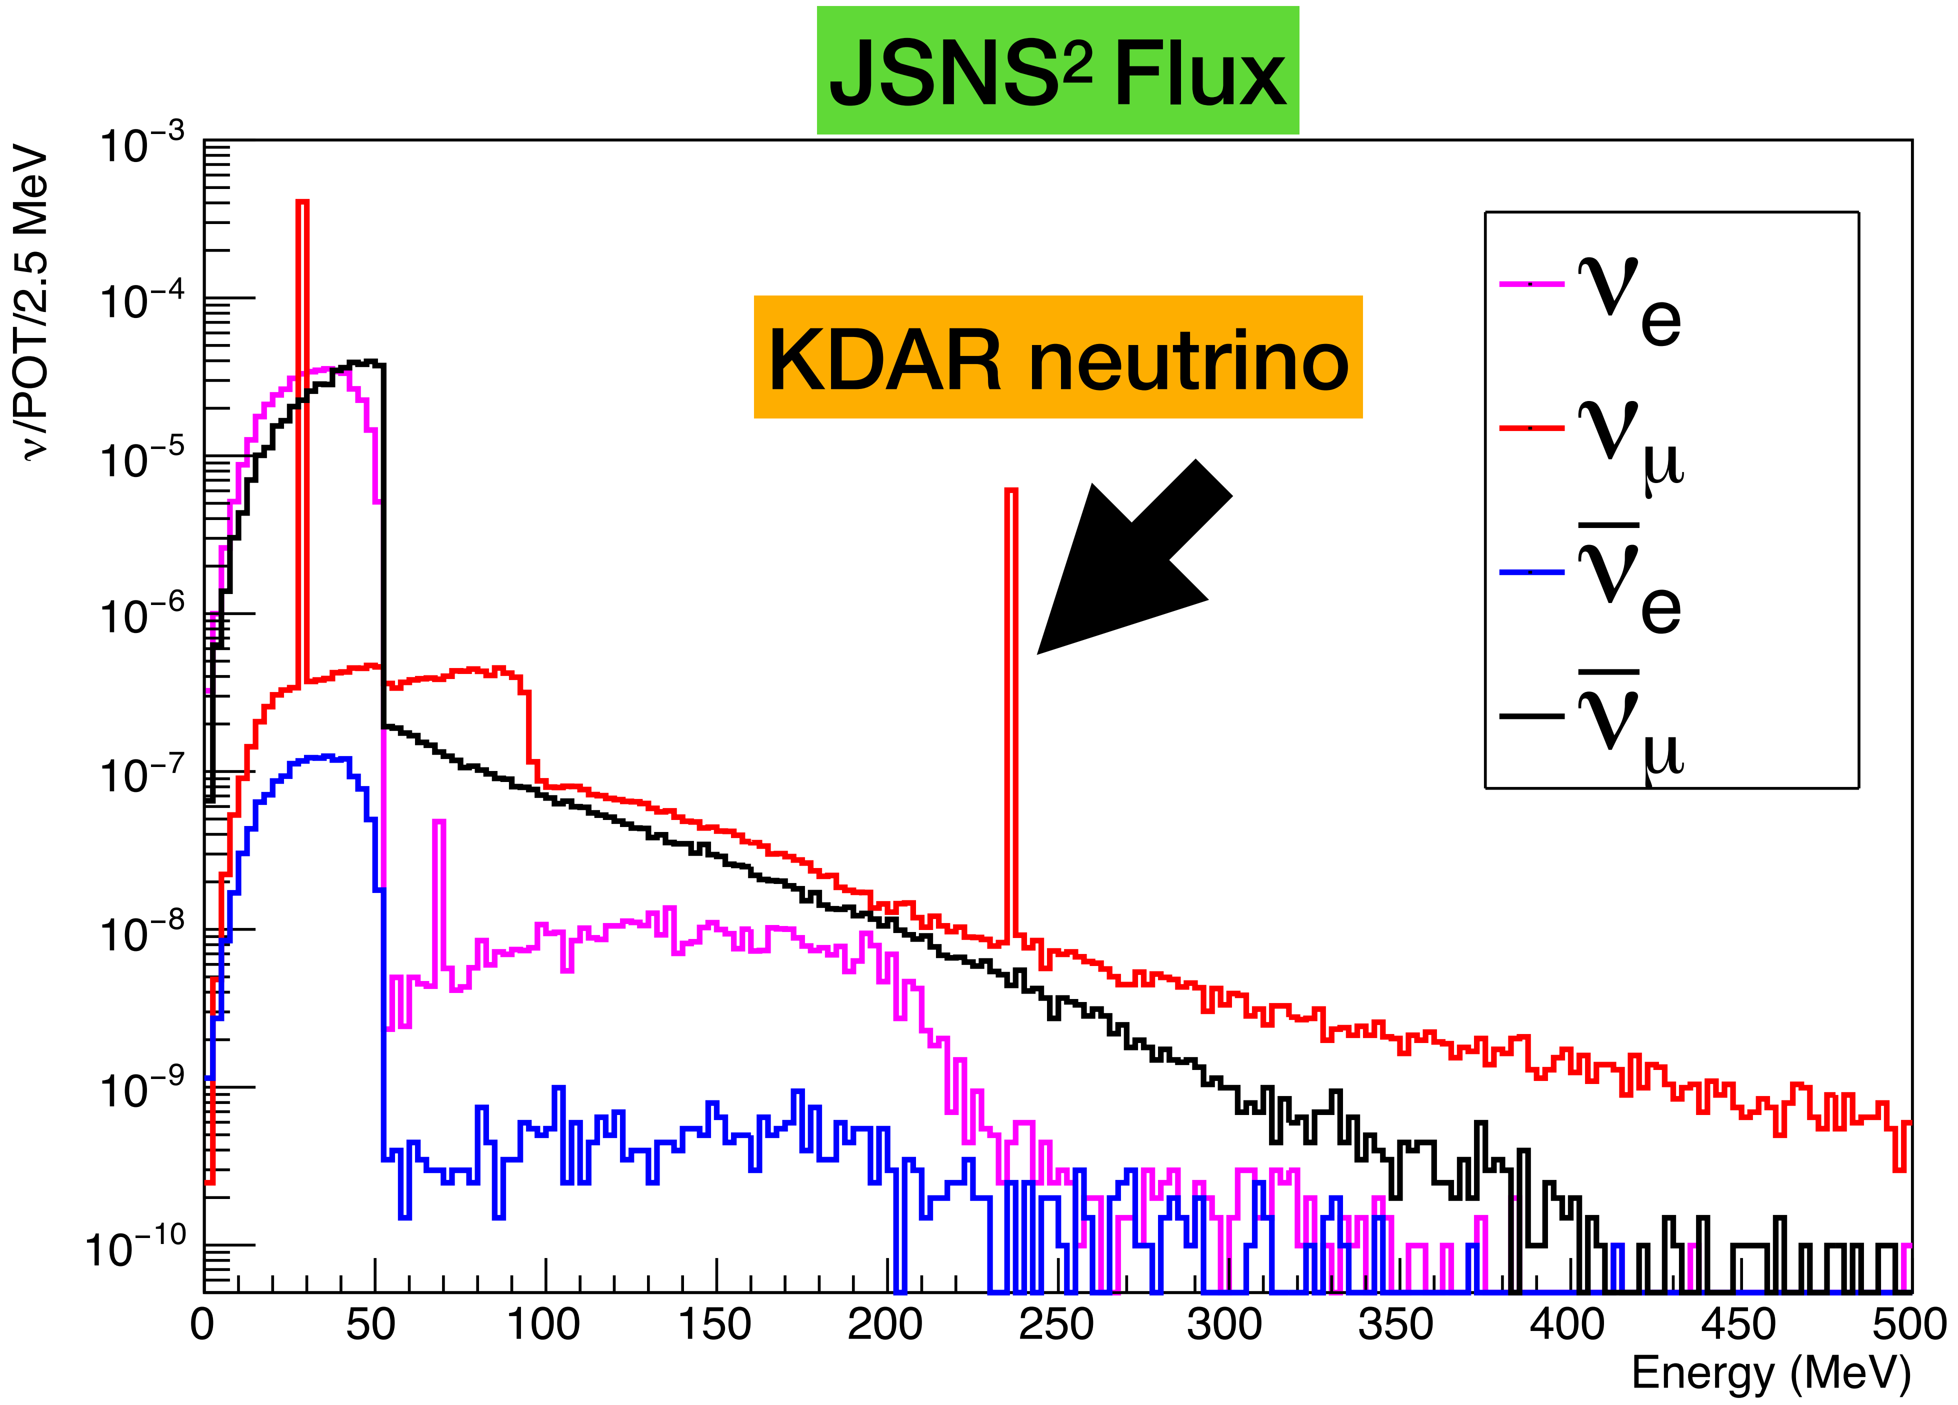
Kaon Decay-At-Rest (KDAR) Neutrino

(Toward first KDAR precise measurement)

Kaon Decay-At-Rest neutrino measurement
(KDAR neutrino: 236 MeV mono-energetic)

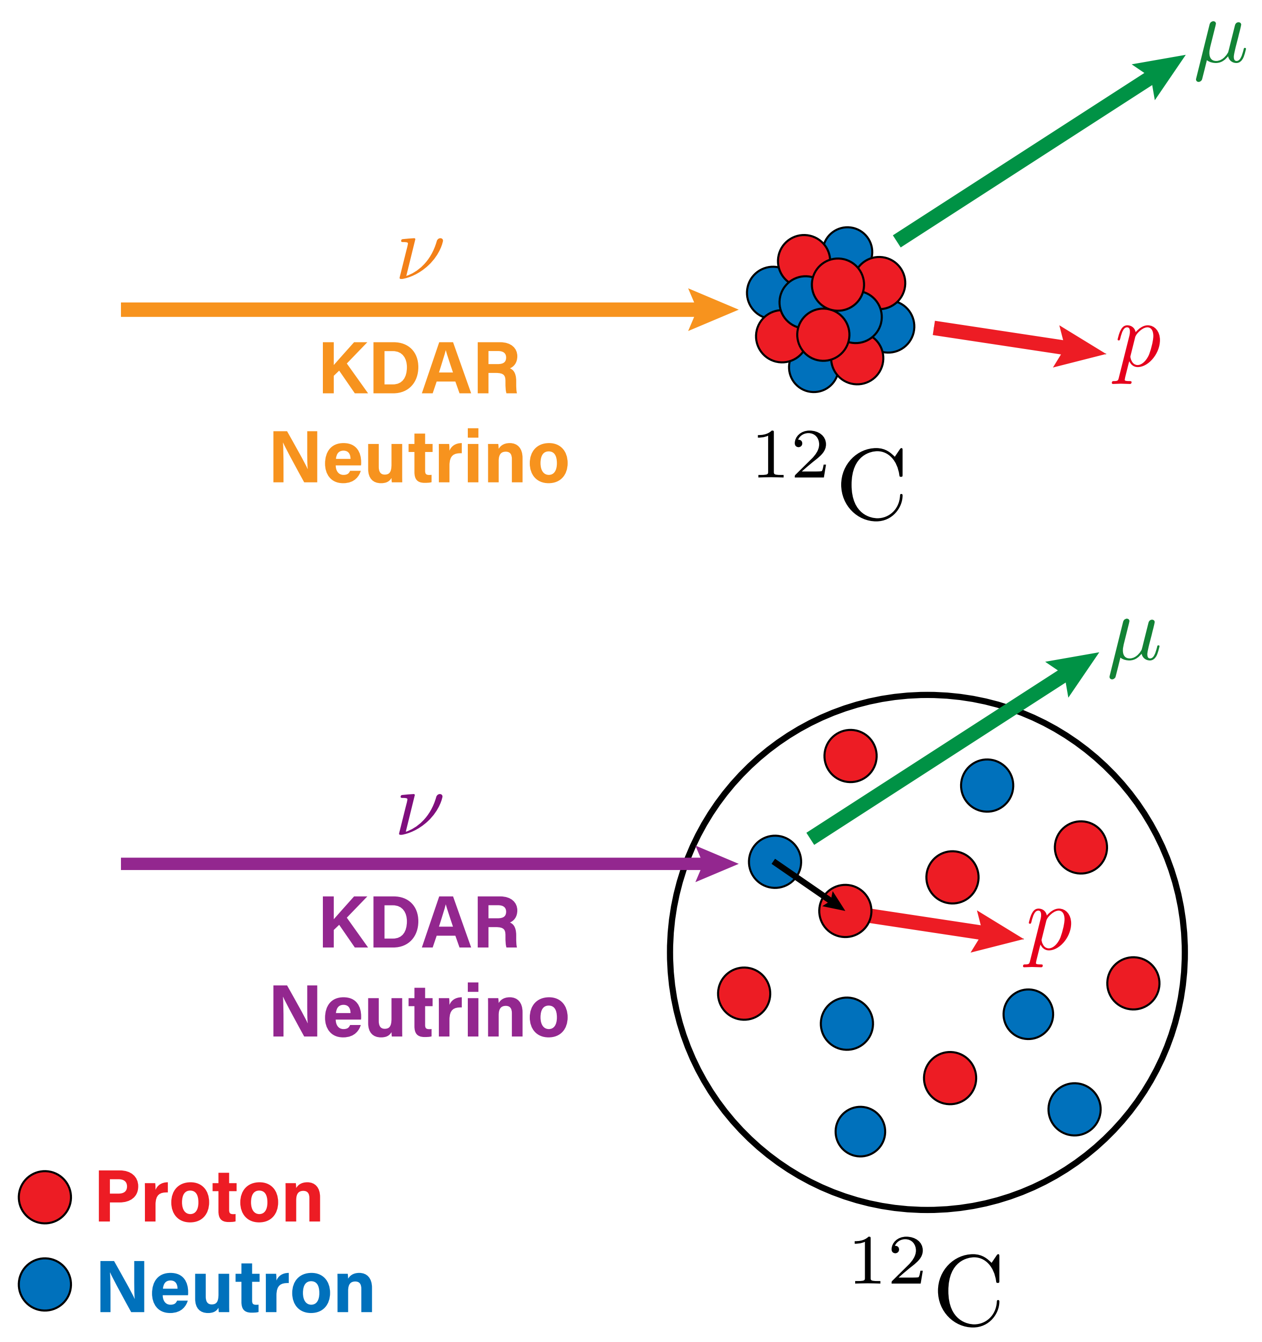
- Neutrino interaction models are a crucial part of neutrino physics, but poorly known at low energies.
- **The JSNS^2 detector has the unique ability to measure the mono-energetic KDAR neutrino.**
- Note that horn focused beam can not make a decay-at-rest neutrino.

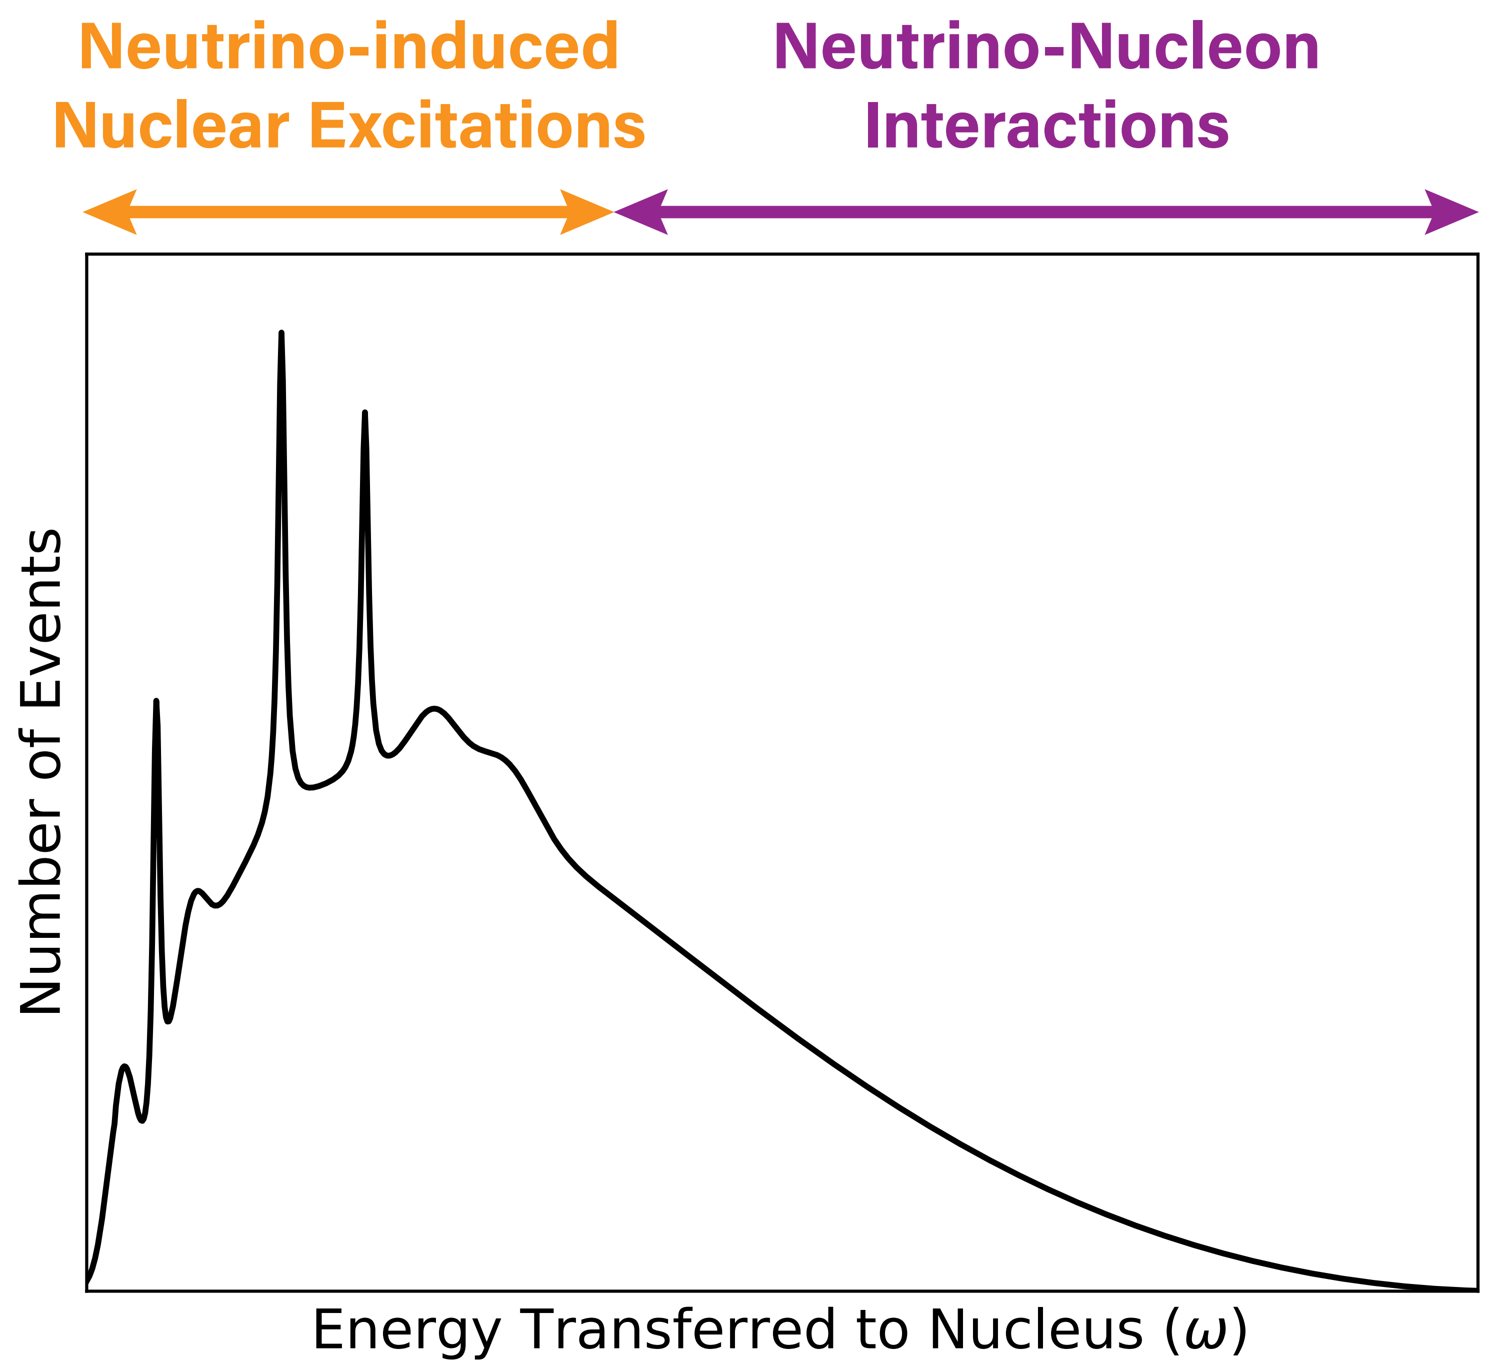




Probing the nucleus with KDAR neutrinos

- KDAR neutrinos: a known-energy, weak-interaction-only probe of the nucleus, right at the transition between neutrino-nucleus and neutrino-nucleon scattering





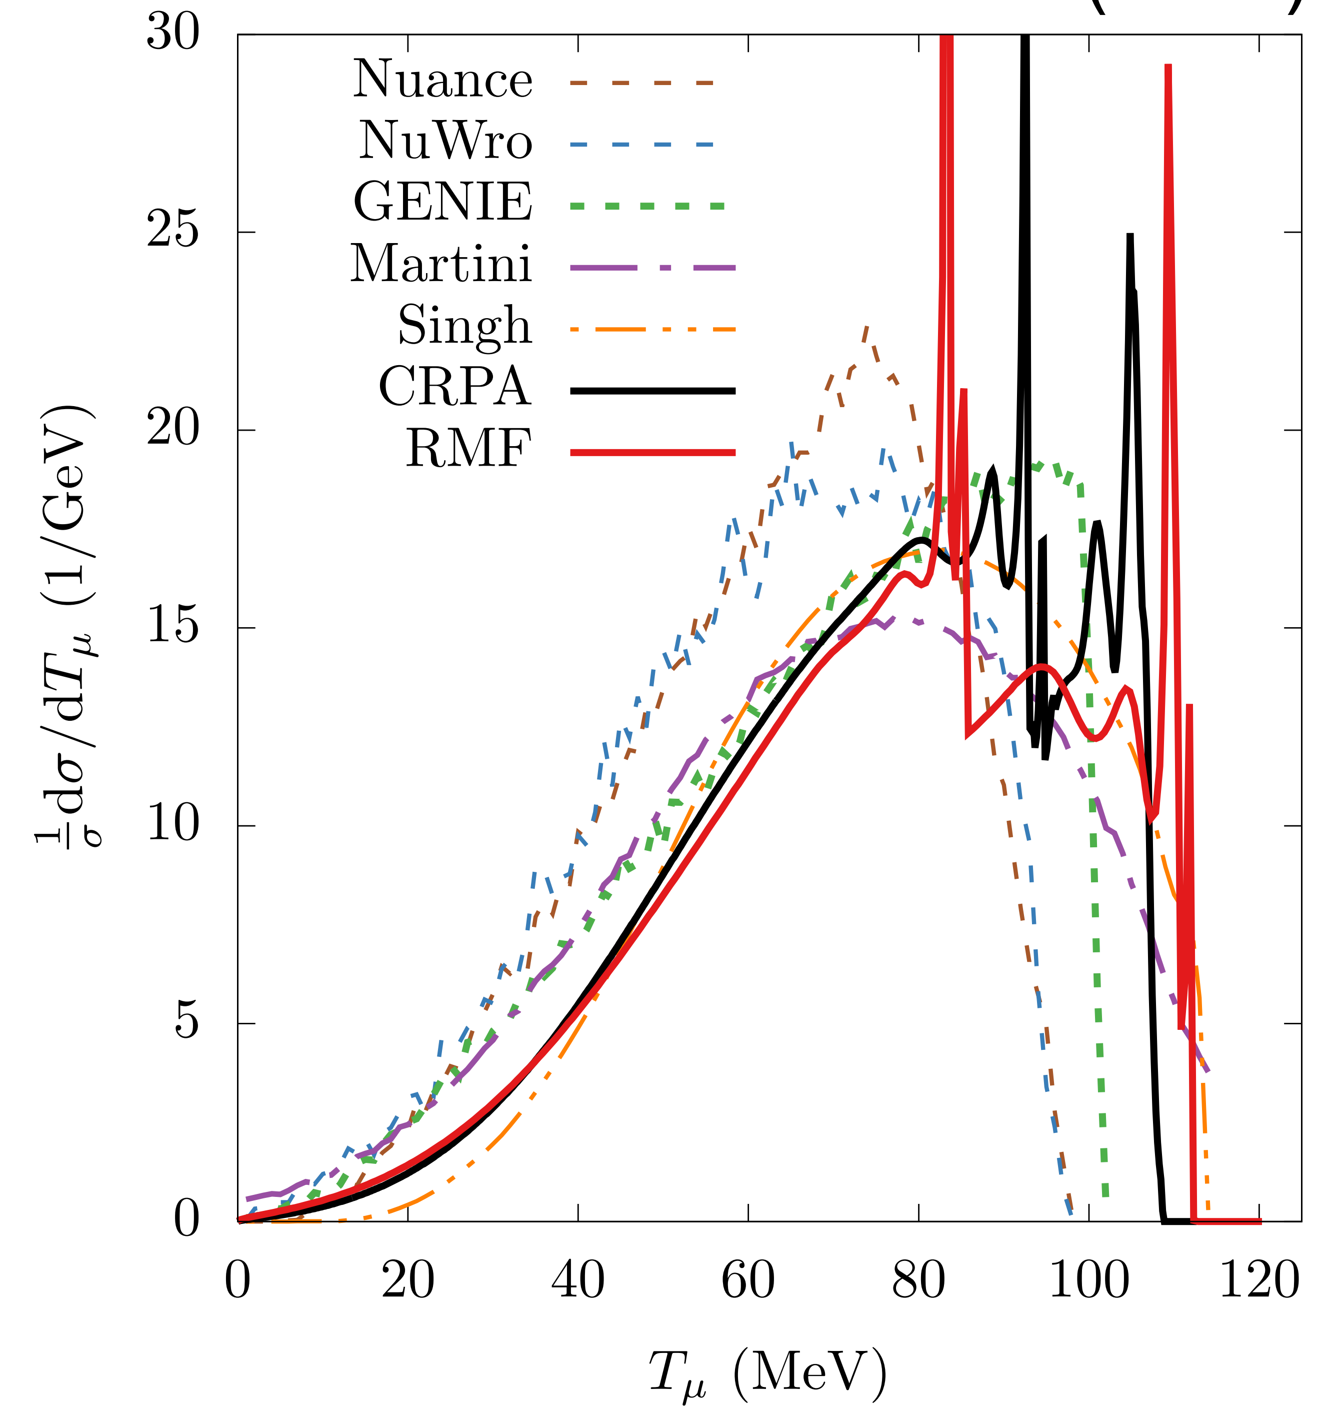
$K^+ \to \mu^+ \nu_\mu$ [BR = 63.6 %]

$E_\nu = 236\ MeV$ if K^+ is at rest

Why it is important

- The transition region between neutrino-nucleus and neutrino-nucleon scattering is very hard to model
- Models and generators strongly disagree.

PRC 103 064603 (2021)

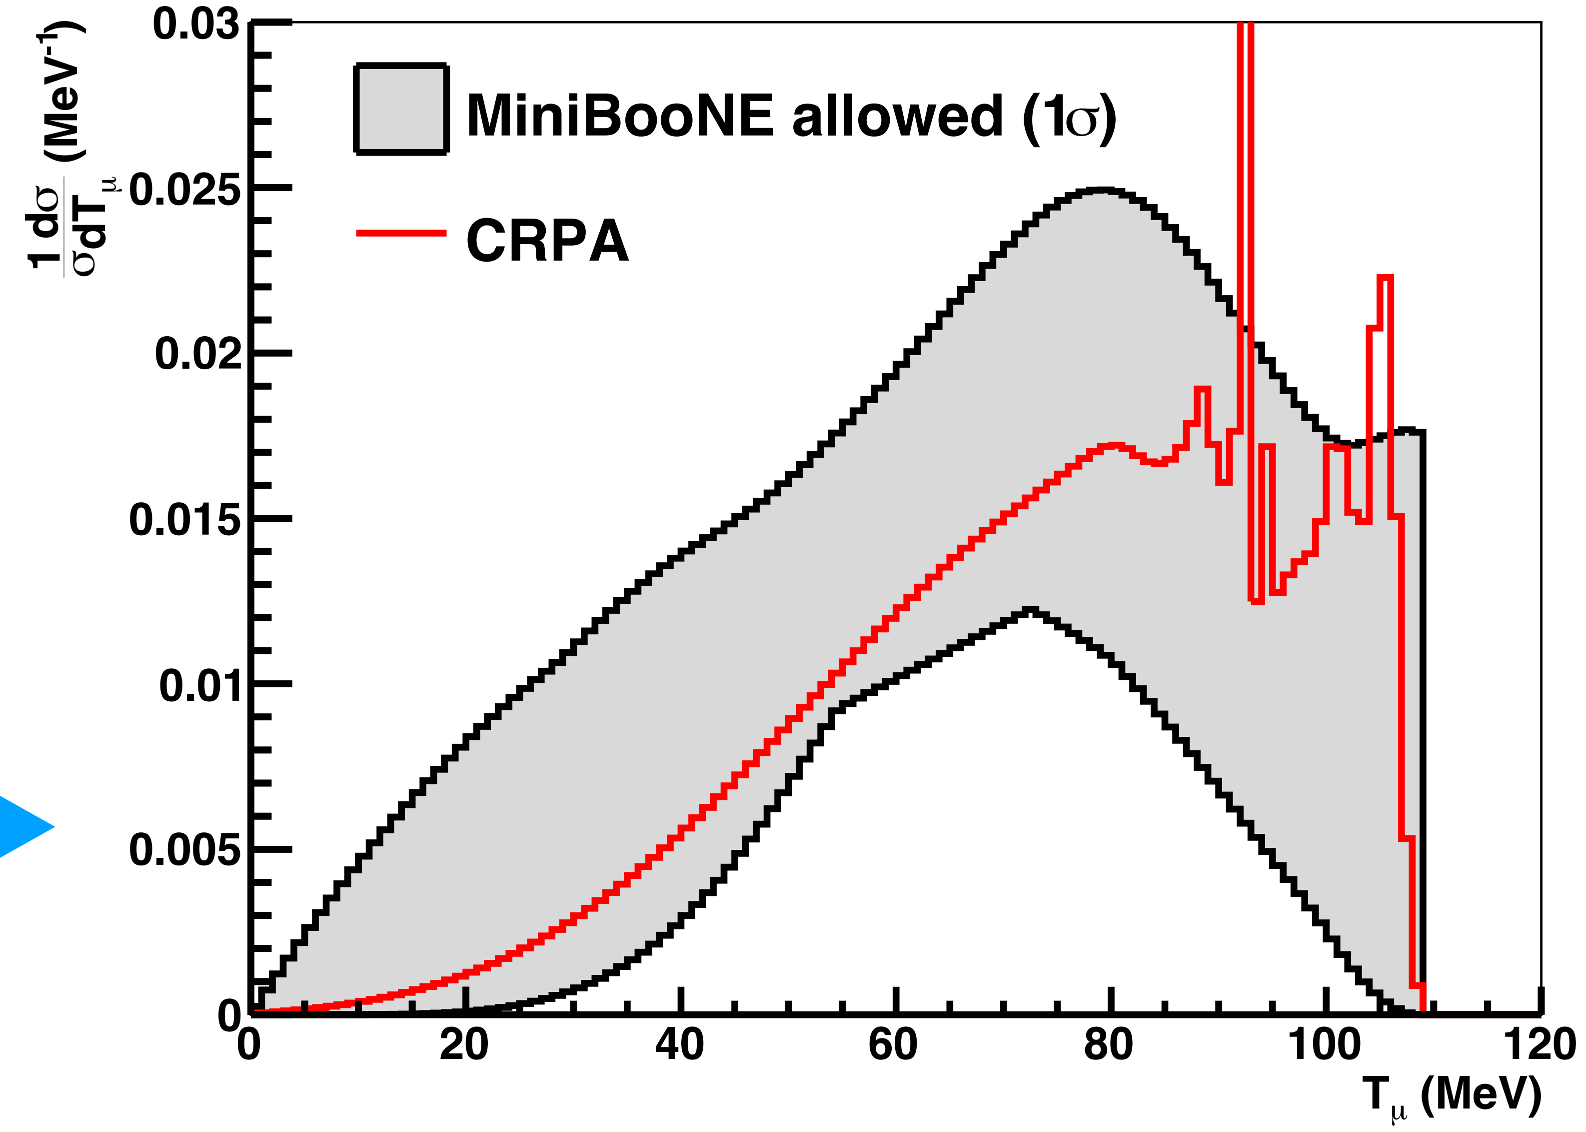


Relevant for:

- Long baseline exps and modeling of neutrino-nucleus interactions in the 100s-of-MeV region.
- Understanding MiniBooNE low-energy excess.
- Supernova neutrinos.
- Solar dark matter annihilation signatures.
- Future oscillation searches with KDAR (muon disappearance and electron appearance)

Only previous KDAR measurement (MiniBooNE)
[3.9 σ first observation of KDAR neutrinos]

MiniBooNE, PRL 120 141802 (2018)



KDAR signal measurement in JSNS^2

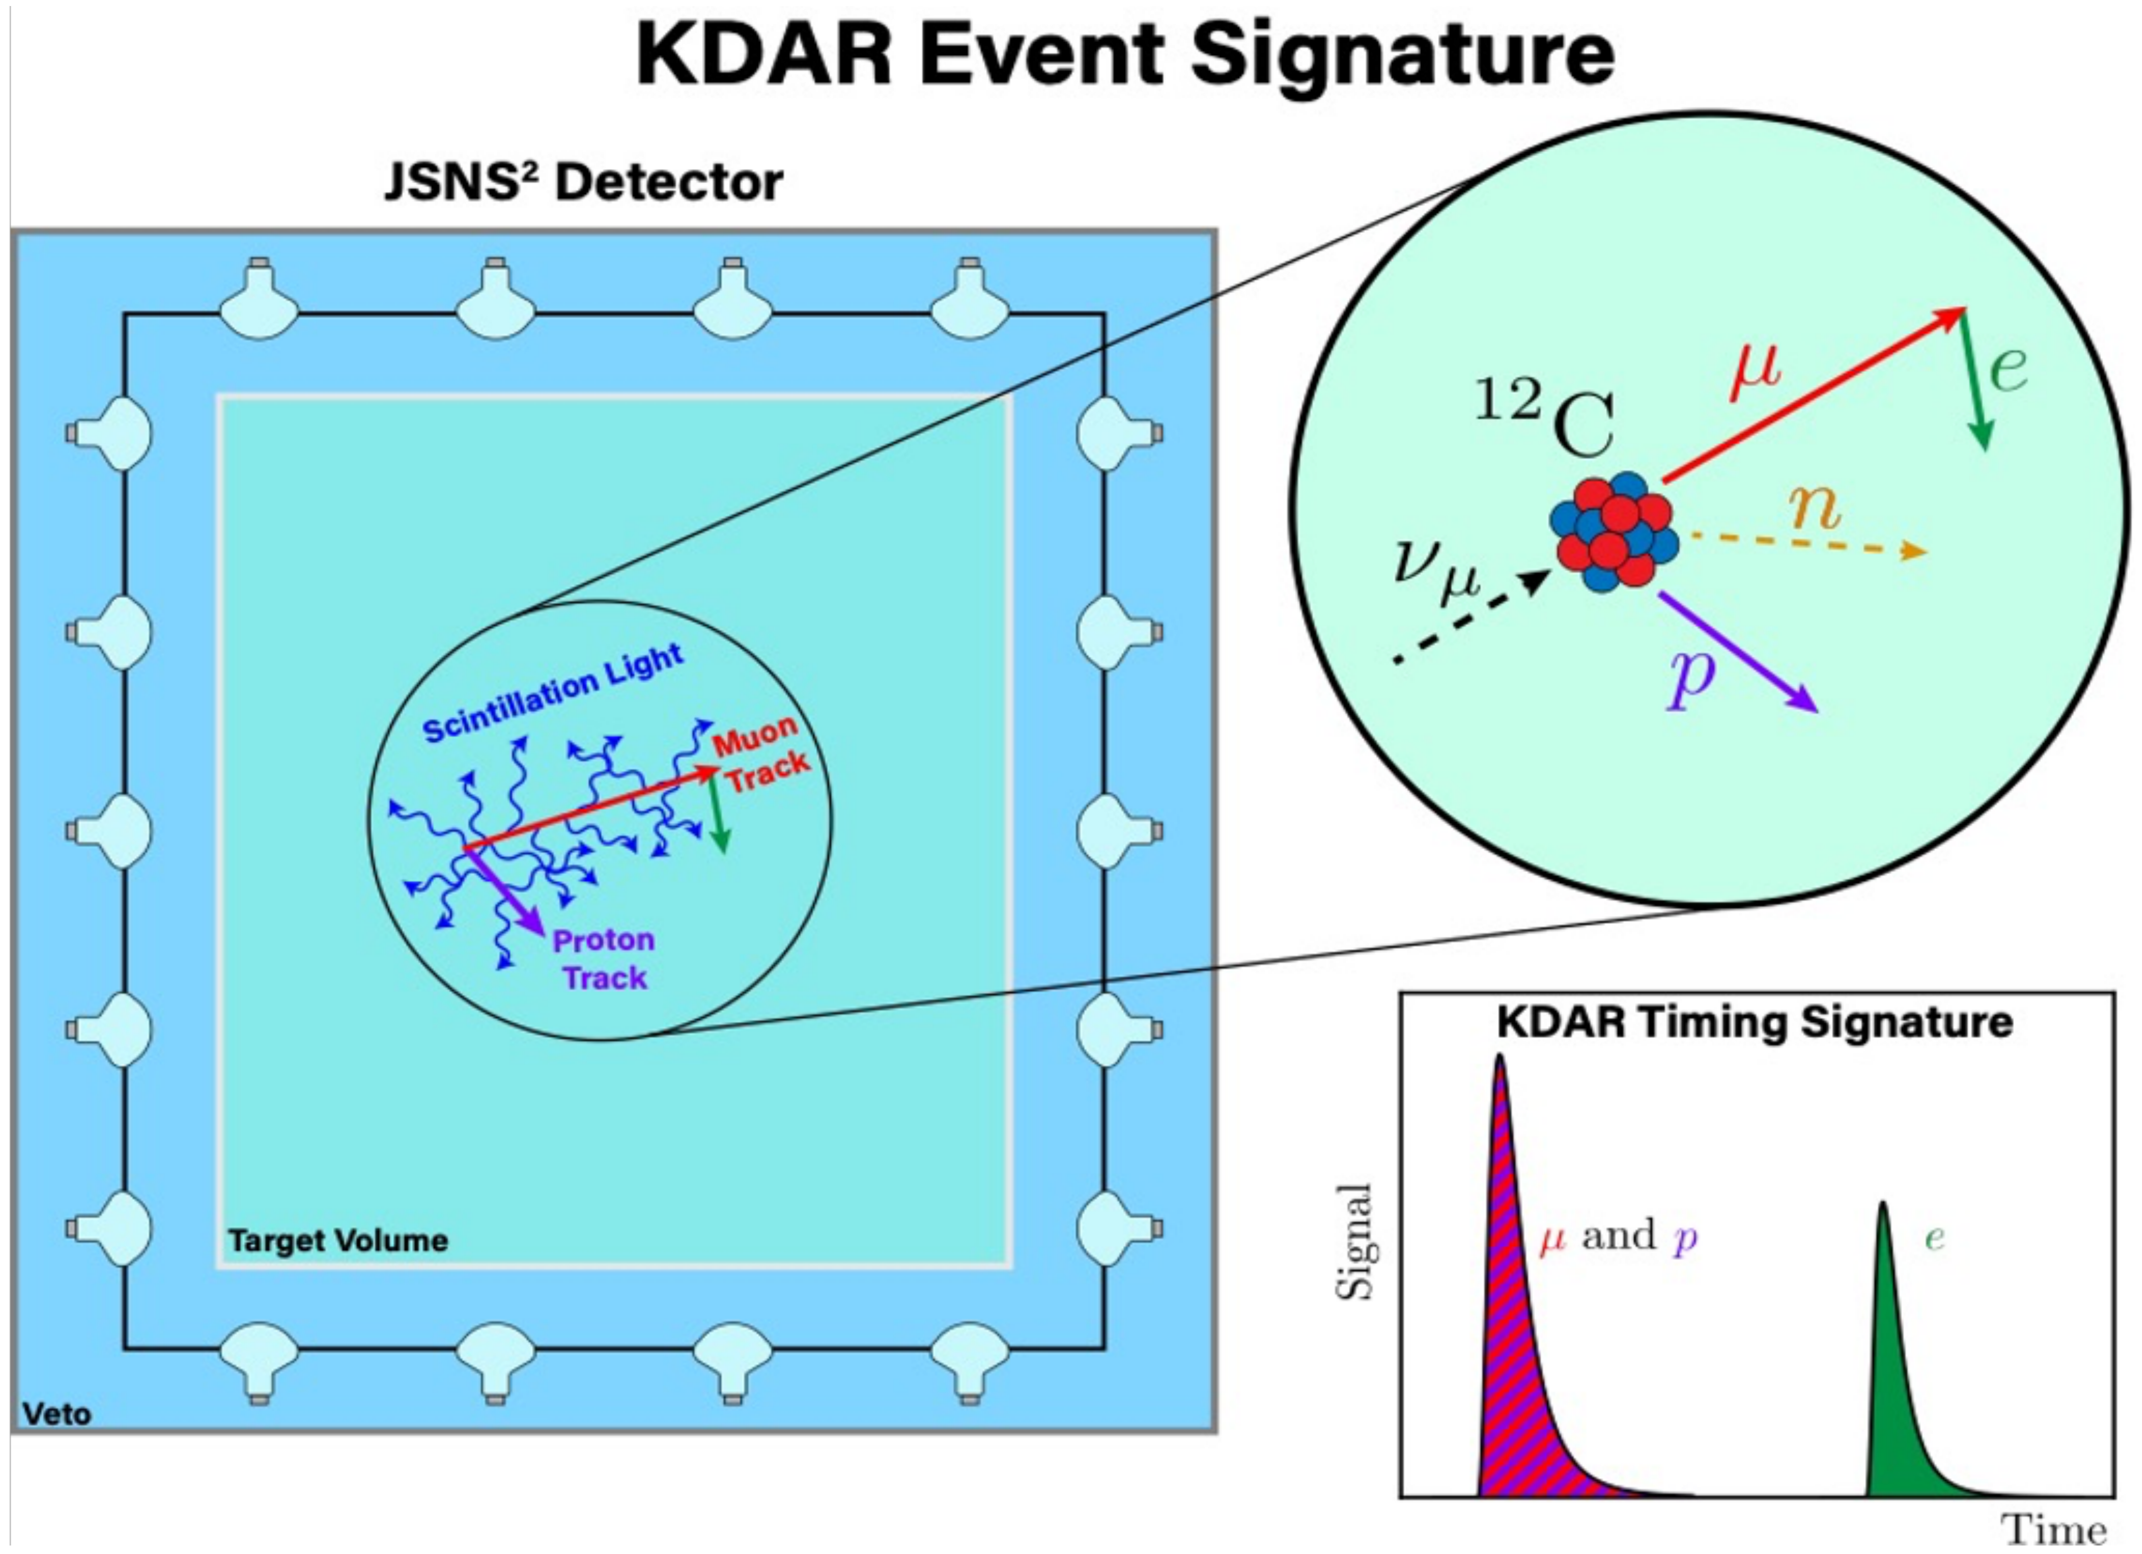
A double coincidence between

- The initial neutrino interaction products and the subsequent muon decay.

KDAR $K^+ \rightarrow \mu^+ + \nu_\mu$

Prompt $\nu_\mu + {}^{12}C \rightarrow X + \mu^-$

Delayed $\mu^- \rightarrow e^- + \bar{\nu}_e + \nu_\mu$



KDAR event selection

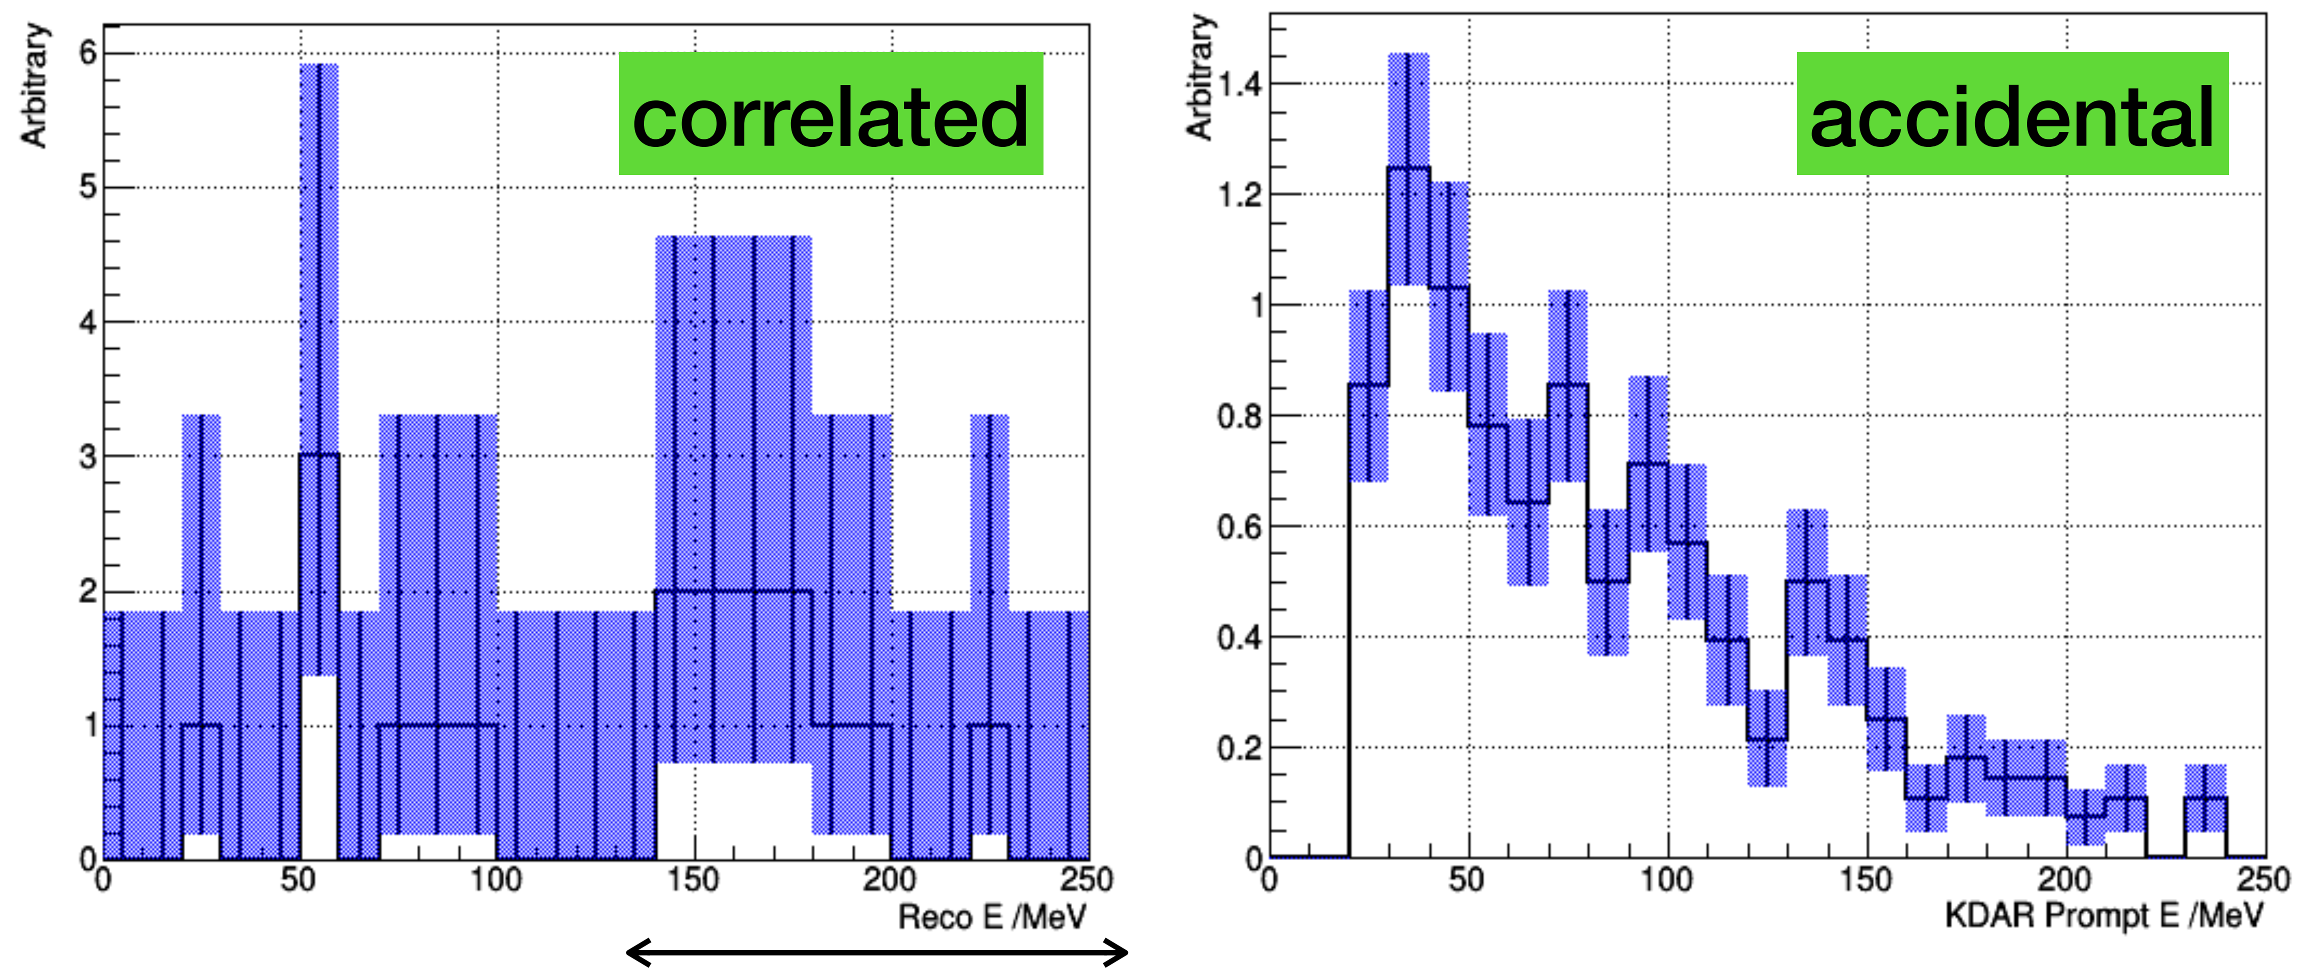
Used data: 2.256×10^{8} spill

- 11.9% of the approved POT

- Identify muon and remove proceeding 10 μs events
- Beam-timing cut (150 ns each)
- Prompt candidate: 20 - 140 MeV (μ^{-})
- Delayed candidate: 20 - 60 MeV (e^{-})
- Delta T: < 10 μs
- Delta vertex: < 300 mm
- Applied the Fiducial cut

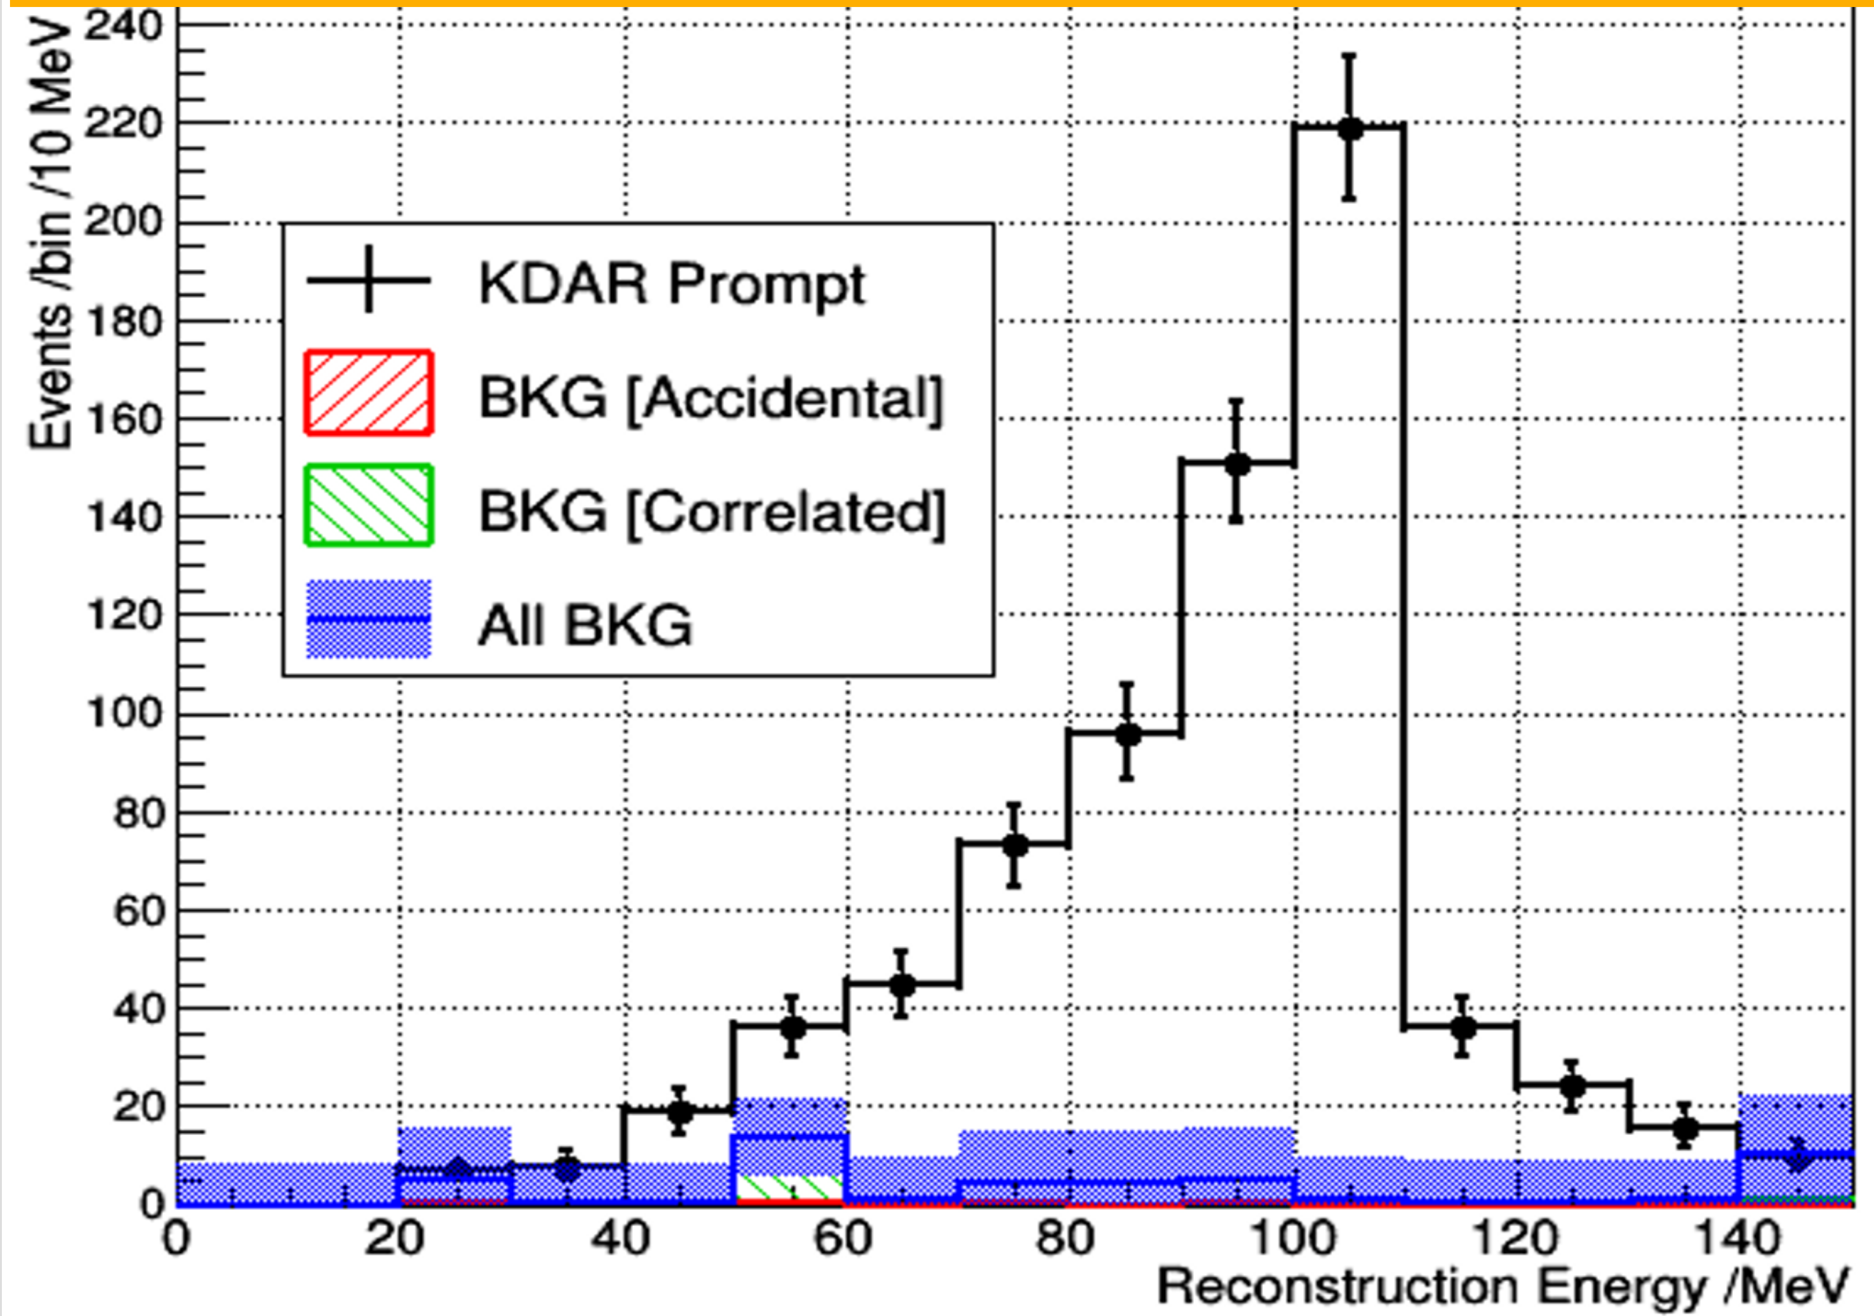
- Background template: timing side-band
- Magnitude: area normalization b/w 140 - 250 MeV

Template of background energy



140 - 250 MeV

Visible energy spectrum w/ backgrounds

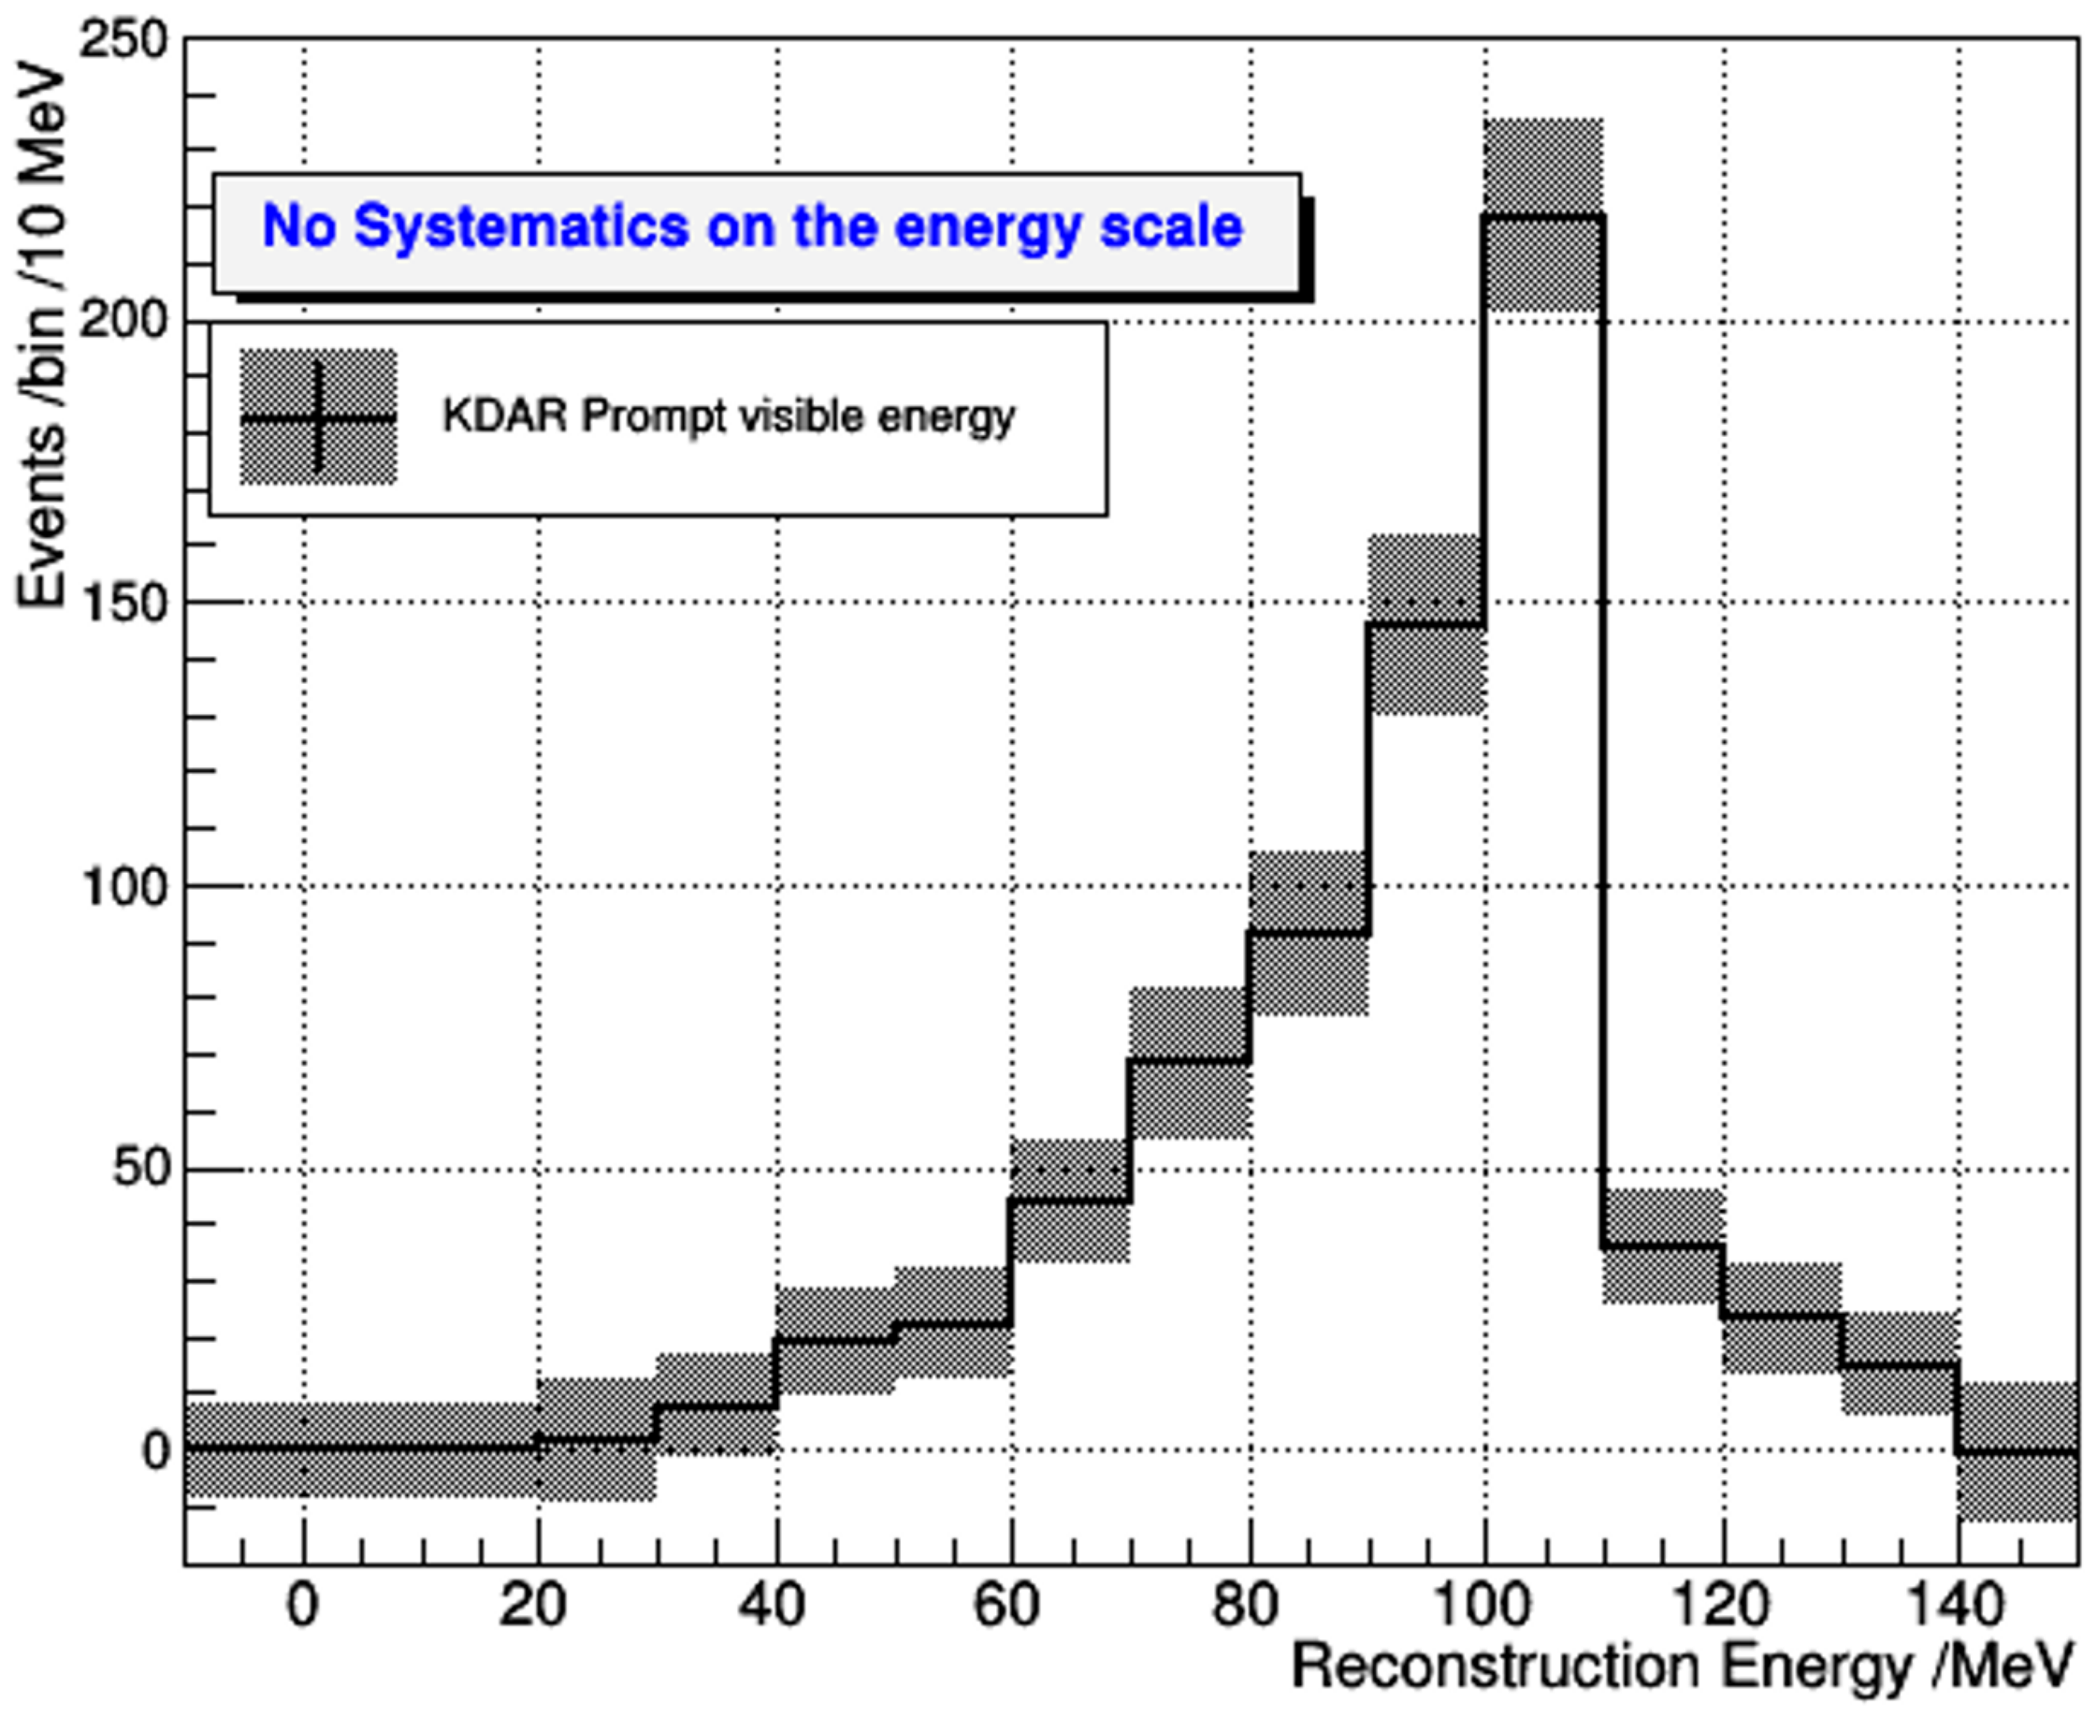


First clear KDAR signal
(Toward first precise KDAR measurement)

- **KDAR peak is clearly seen**
- **High purity (95%)** KDAR signal
  - Background: 5.2 %

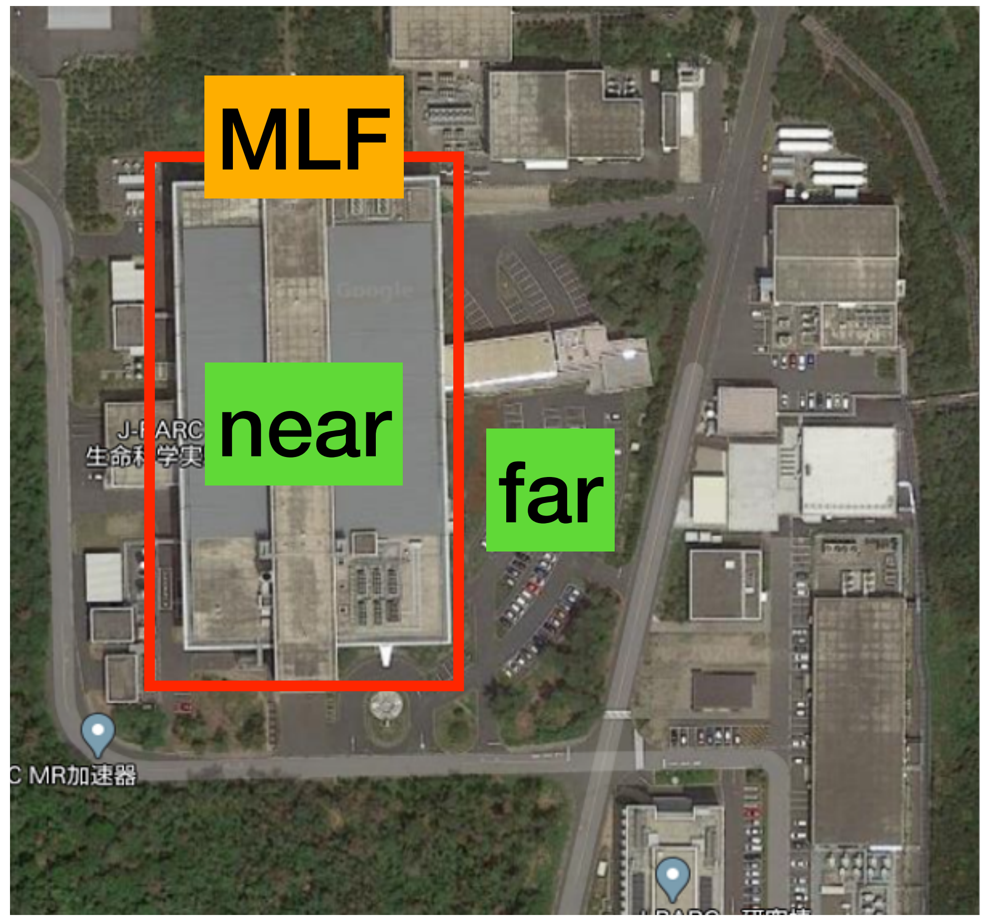
- Note that **the systematics on the energy scale are not included yet.**

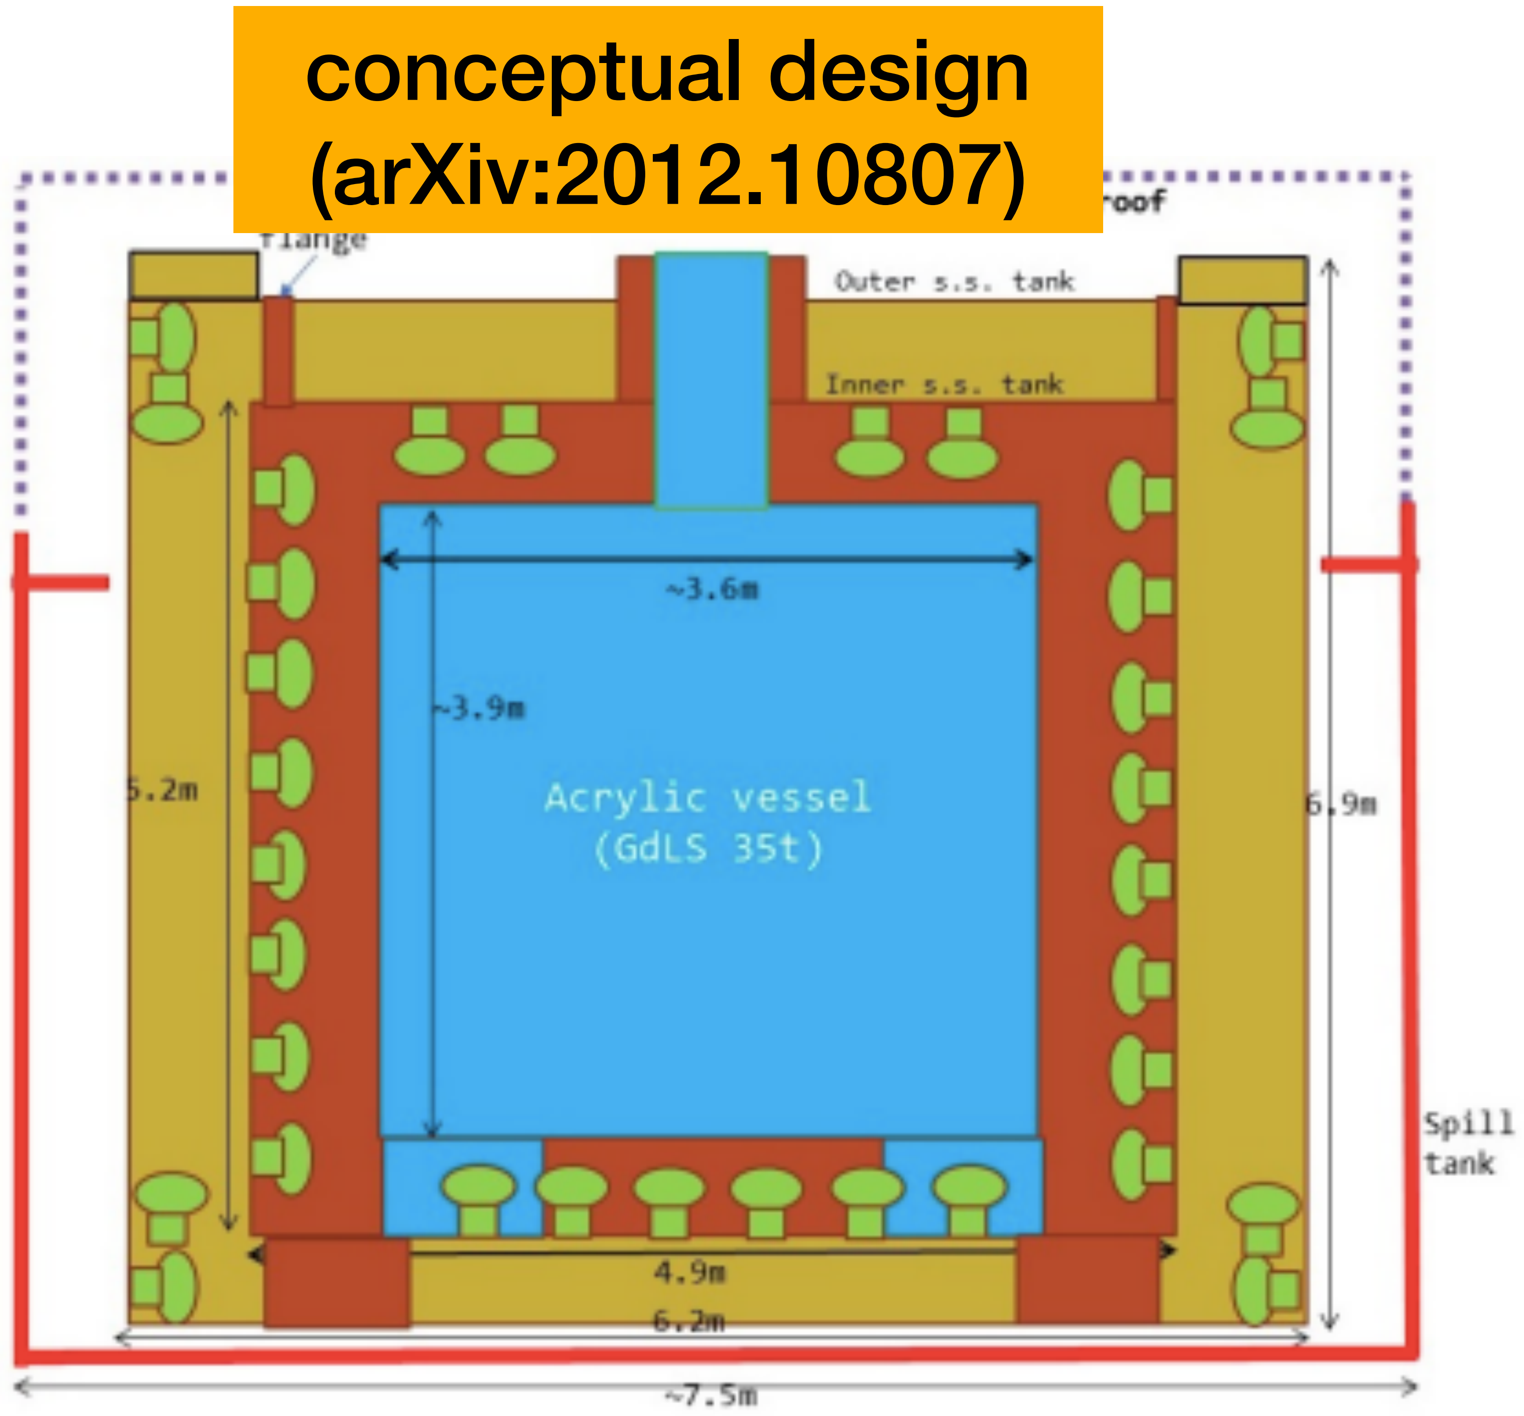
BKG ID	Correlated/ Accidental	BKG (# of events)	
1	Correlated	36.6 ± 34.8	$5.0 \pm 5.1\%$
2	Accidental	1.5 ± 0.1	$0.2 \pm 0.01\%$
KDAR Signal : 730 events		38.1 ± 38.4	$5.2 \pm 5.3\%$



Toward the second phase ($JSNS^2$-II)

JSNS^2-II
(arXiv:2012.10807)





- Second phase of the JSNS^2 experiment with two detectors
    - near (17 tons, 120 10-inch PMTs, 24 m),
    - far (32 tons, 220 10-inch PMTs, 48 m) detector
    - Improve the sensitivity especially in the low Δm^2 region
    - J-PARC/KEK grants the stage 2 (2/2) approval
    - The stainless steel tank has been constructed
    - A lot of progress about PMTs

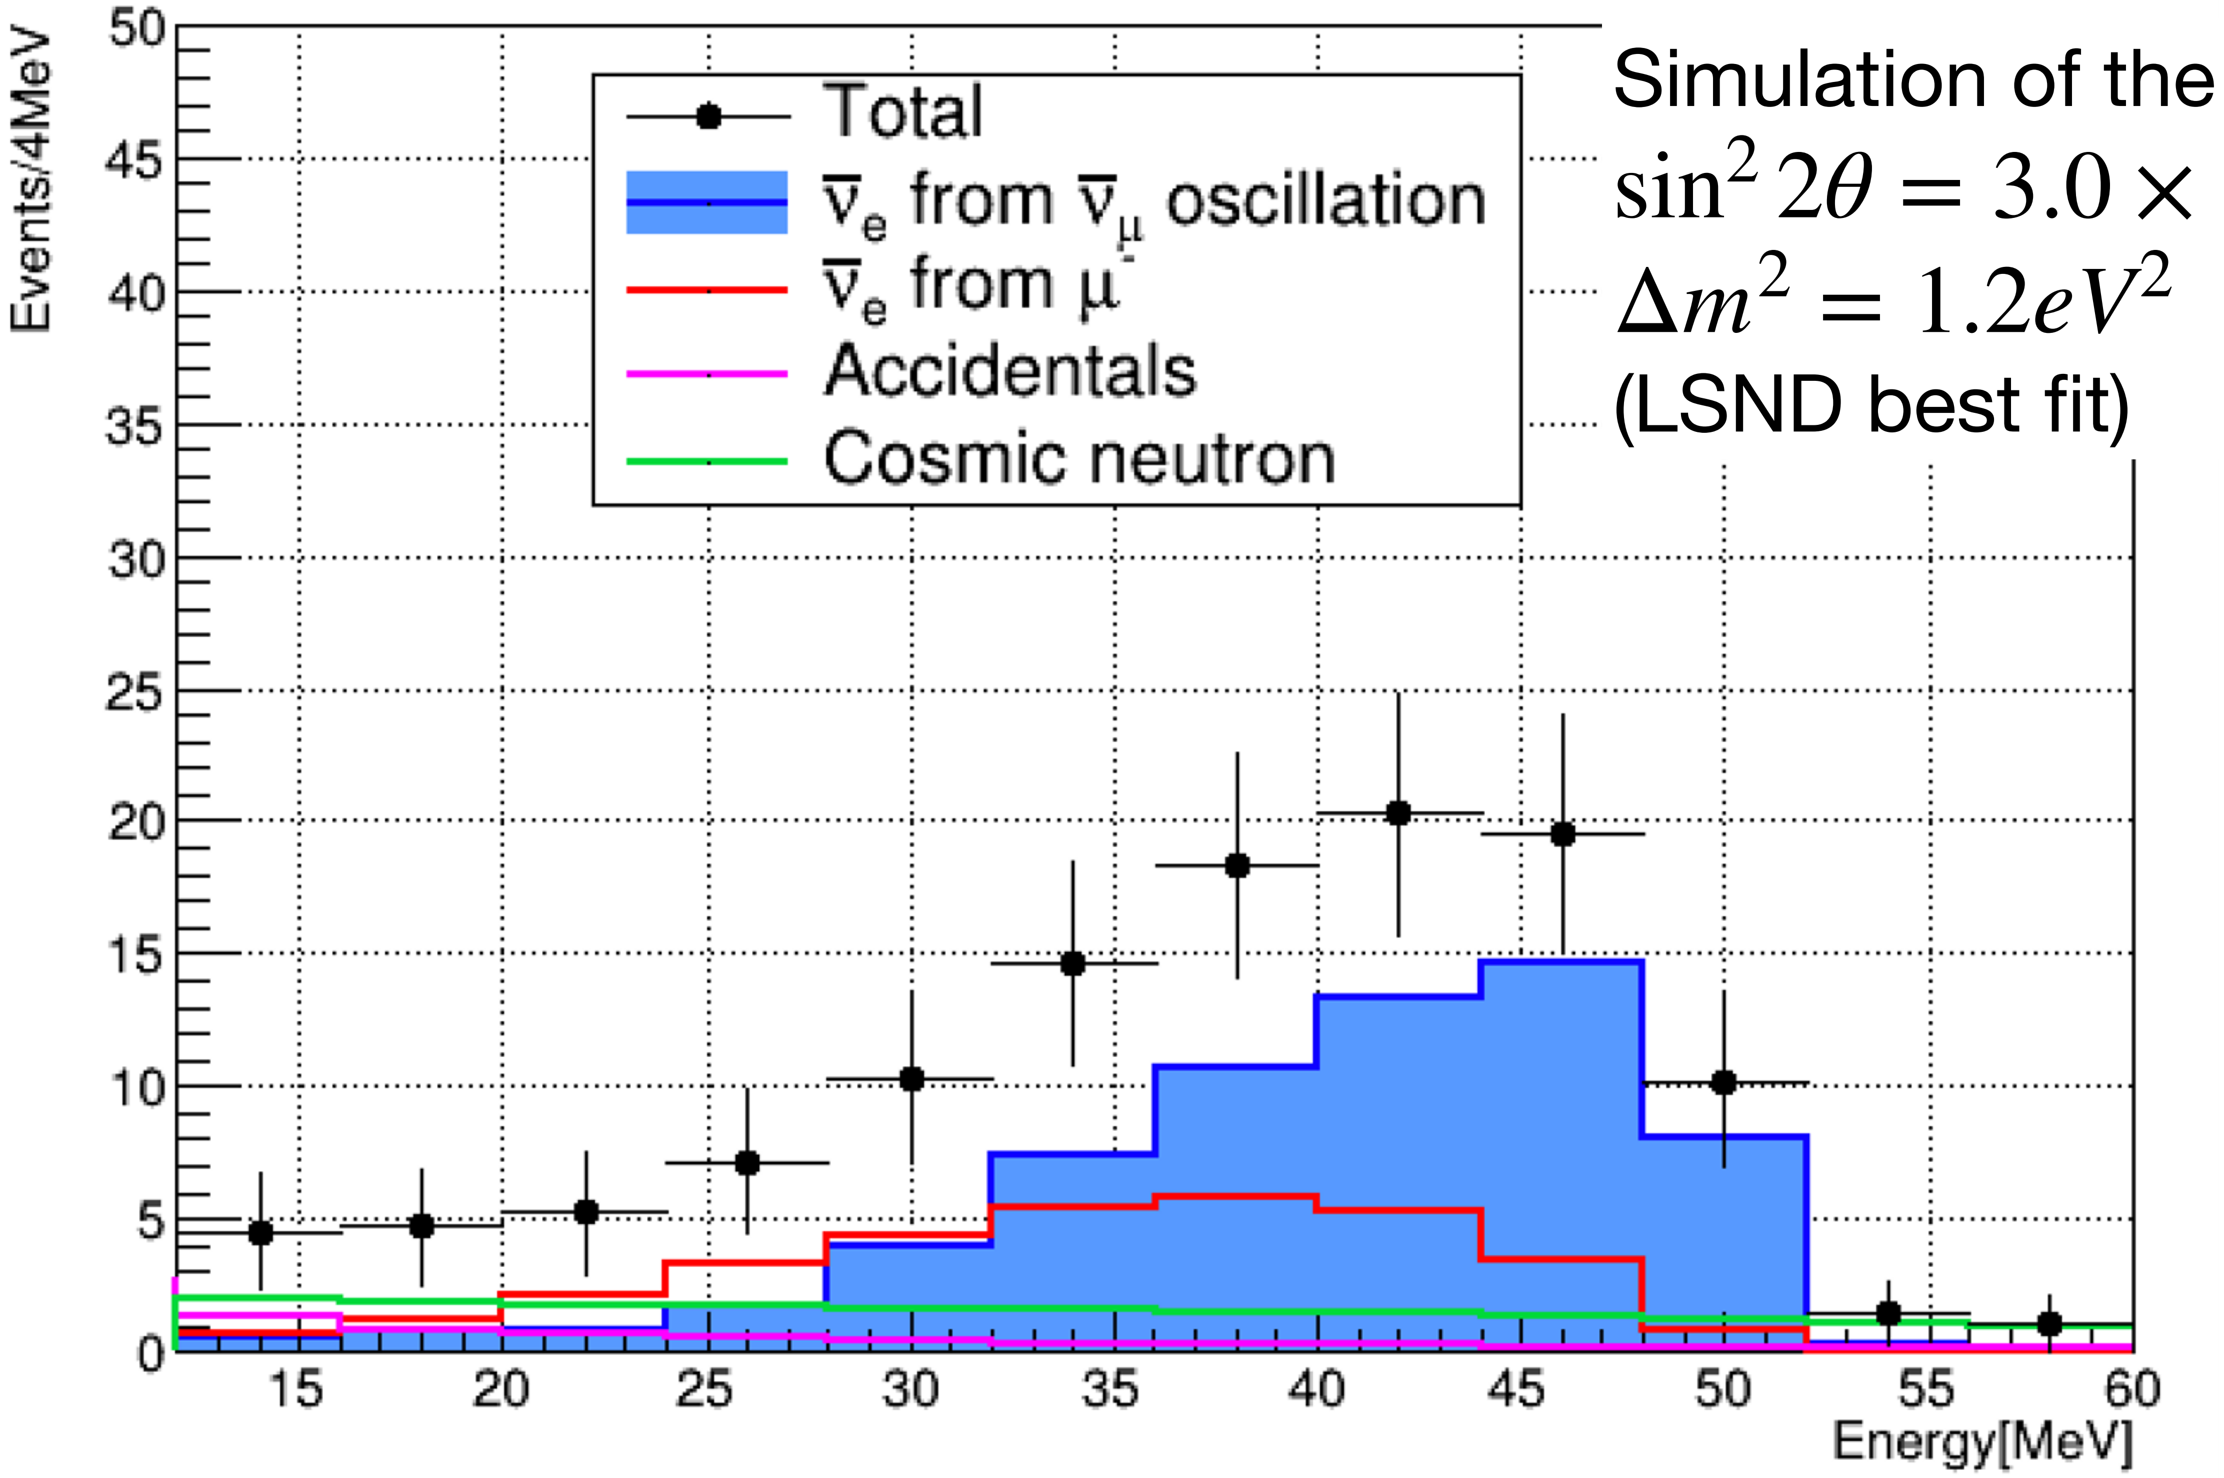
PMTs

- 190 PMTs arrived at J-PARC on June 27 in 2022 (from Paris)
- JSNS^2-II appreciates to Double-Chooz experiment
- Dismantling the DC PMT jigs structure has been finished.
- Dead PMTs checks have been done
- Will be installed in the detector soon.

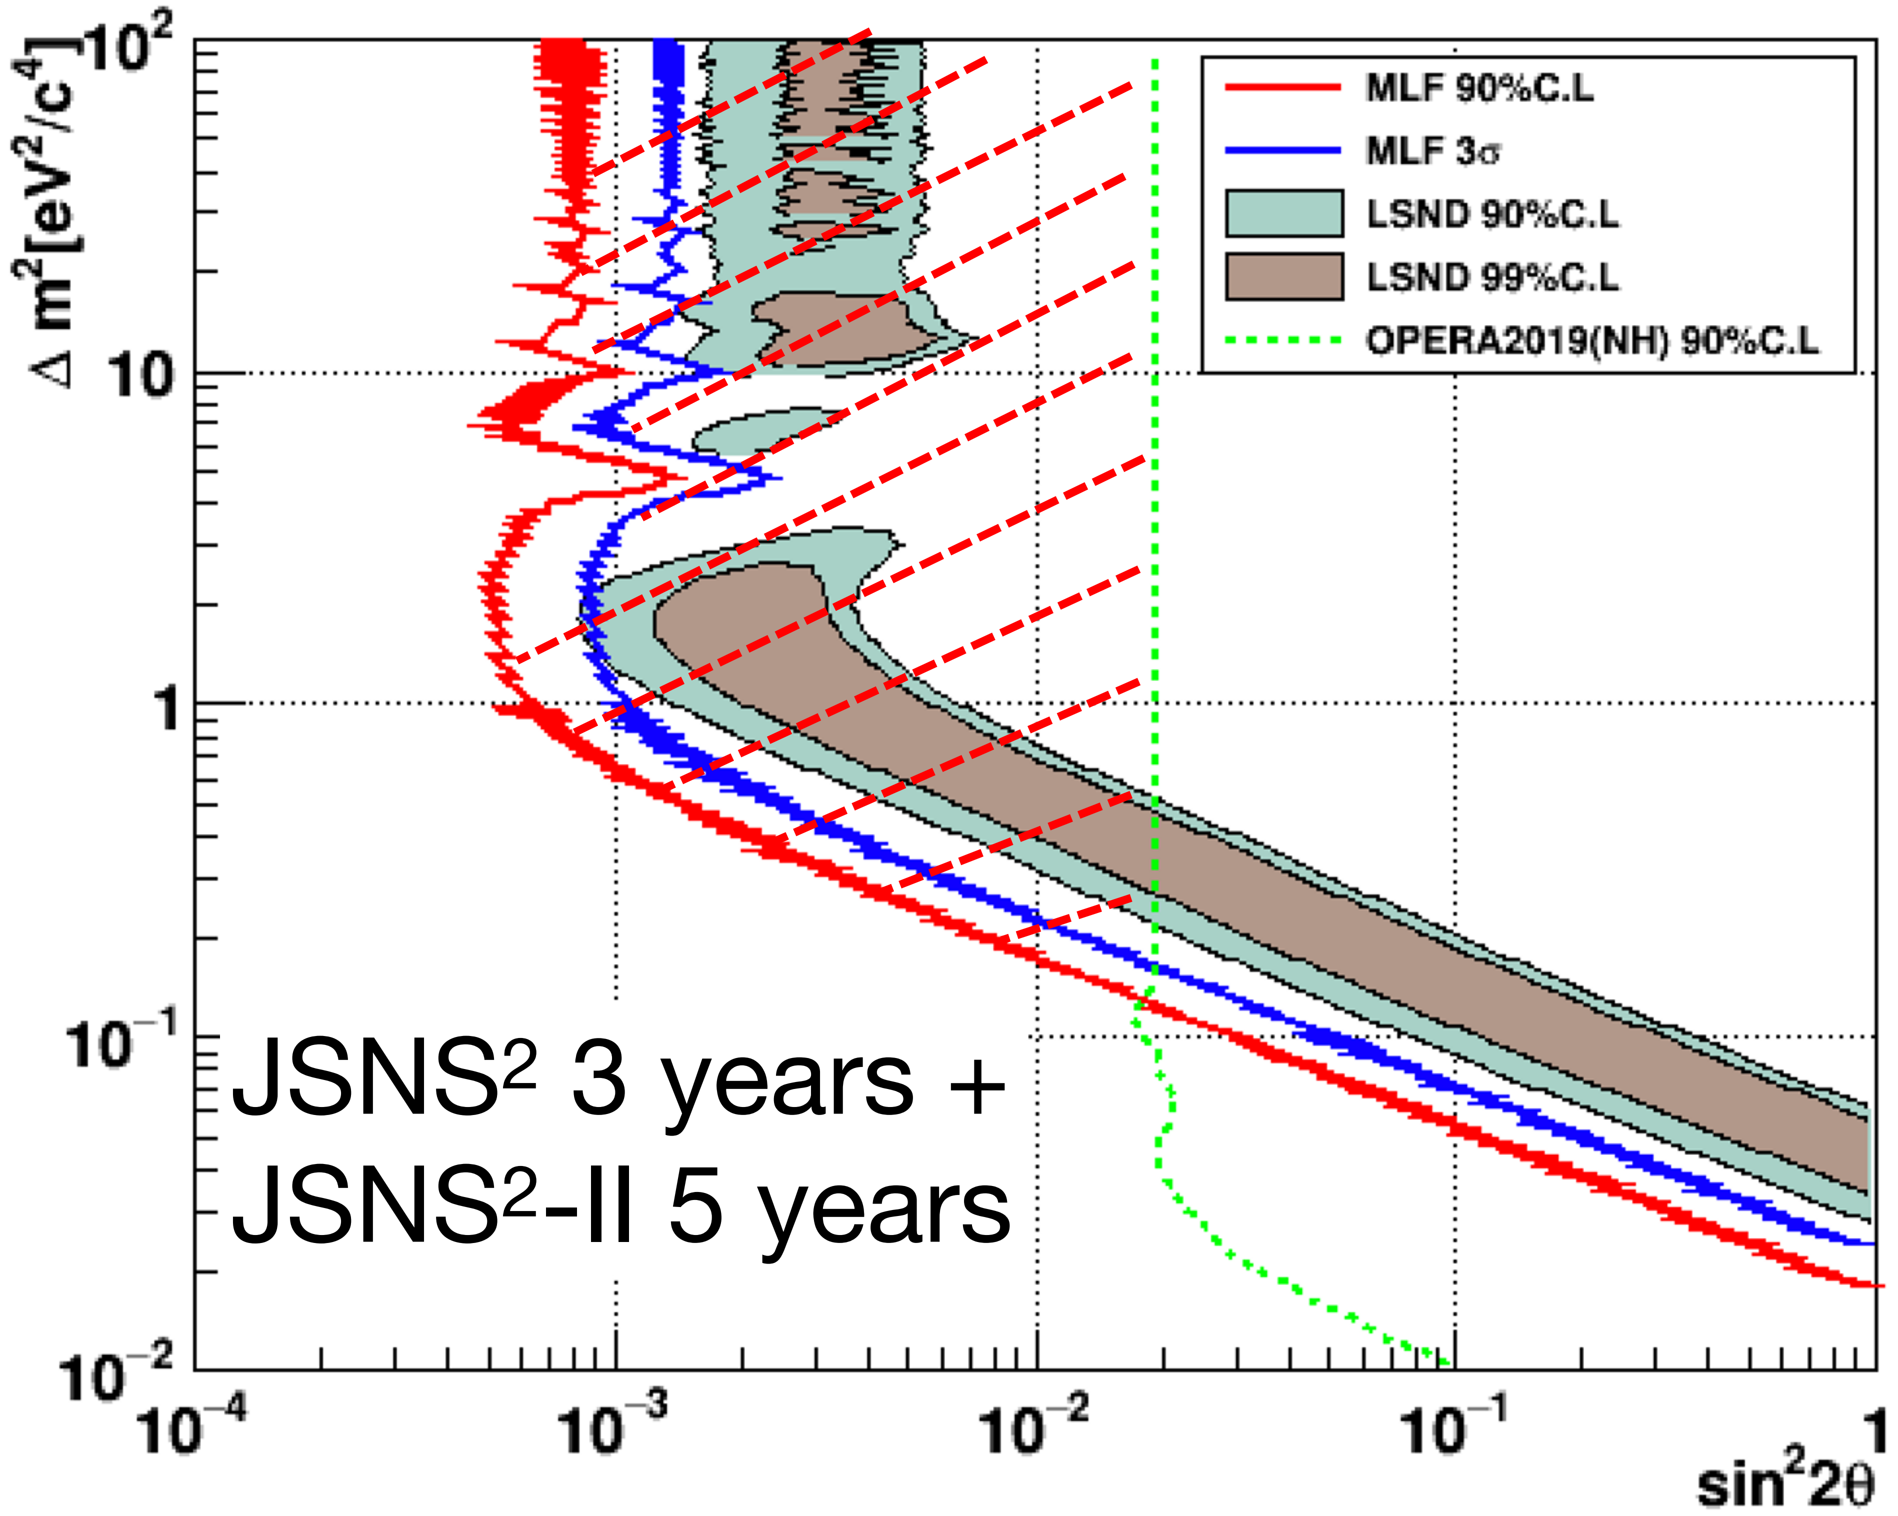
Sensitivity for the JSNS^2-II

(Based on the simulation)

- Each background simulation was done based on the JSNS^2 data
- Covering LSND by 3 sigma



Simulation of the far detector
$\sin^2 2\theta = 3.0 \times 10^{-3}$
$\Delta m^2 = 1.2eV^2$
(LSND best fit)



JSNS^2-II: Schedule

(Even under the COVID-19, the overall schedule was well followed from 2021's plan)

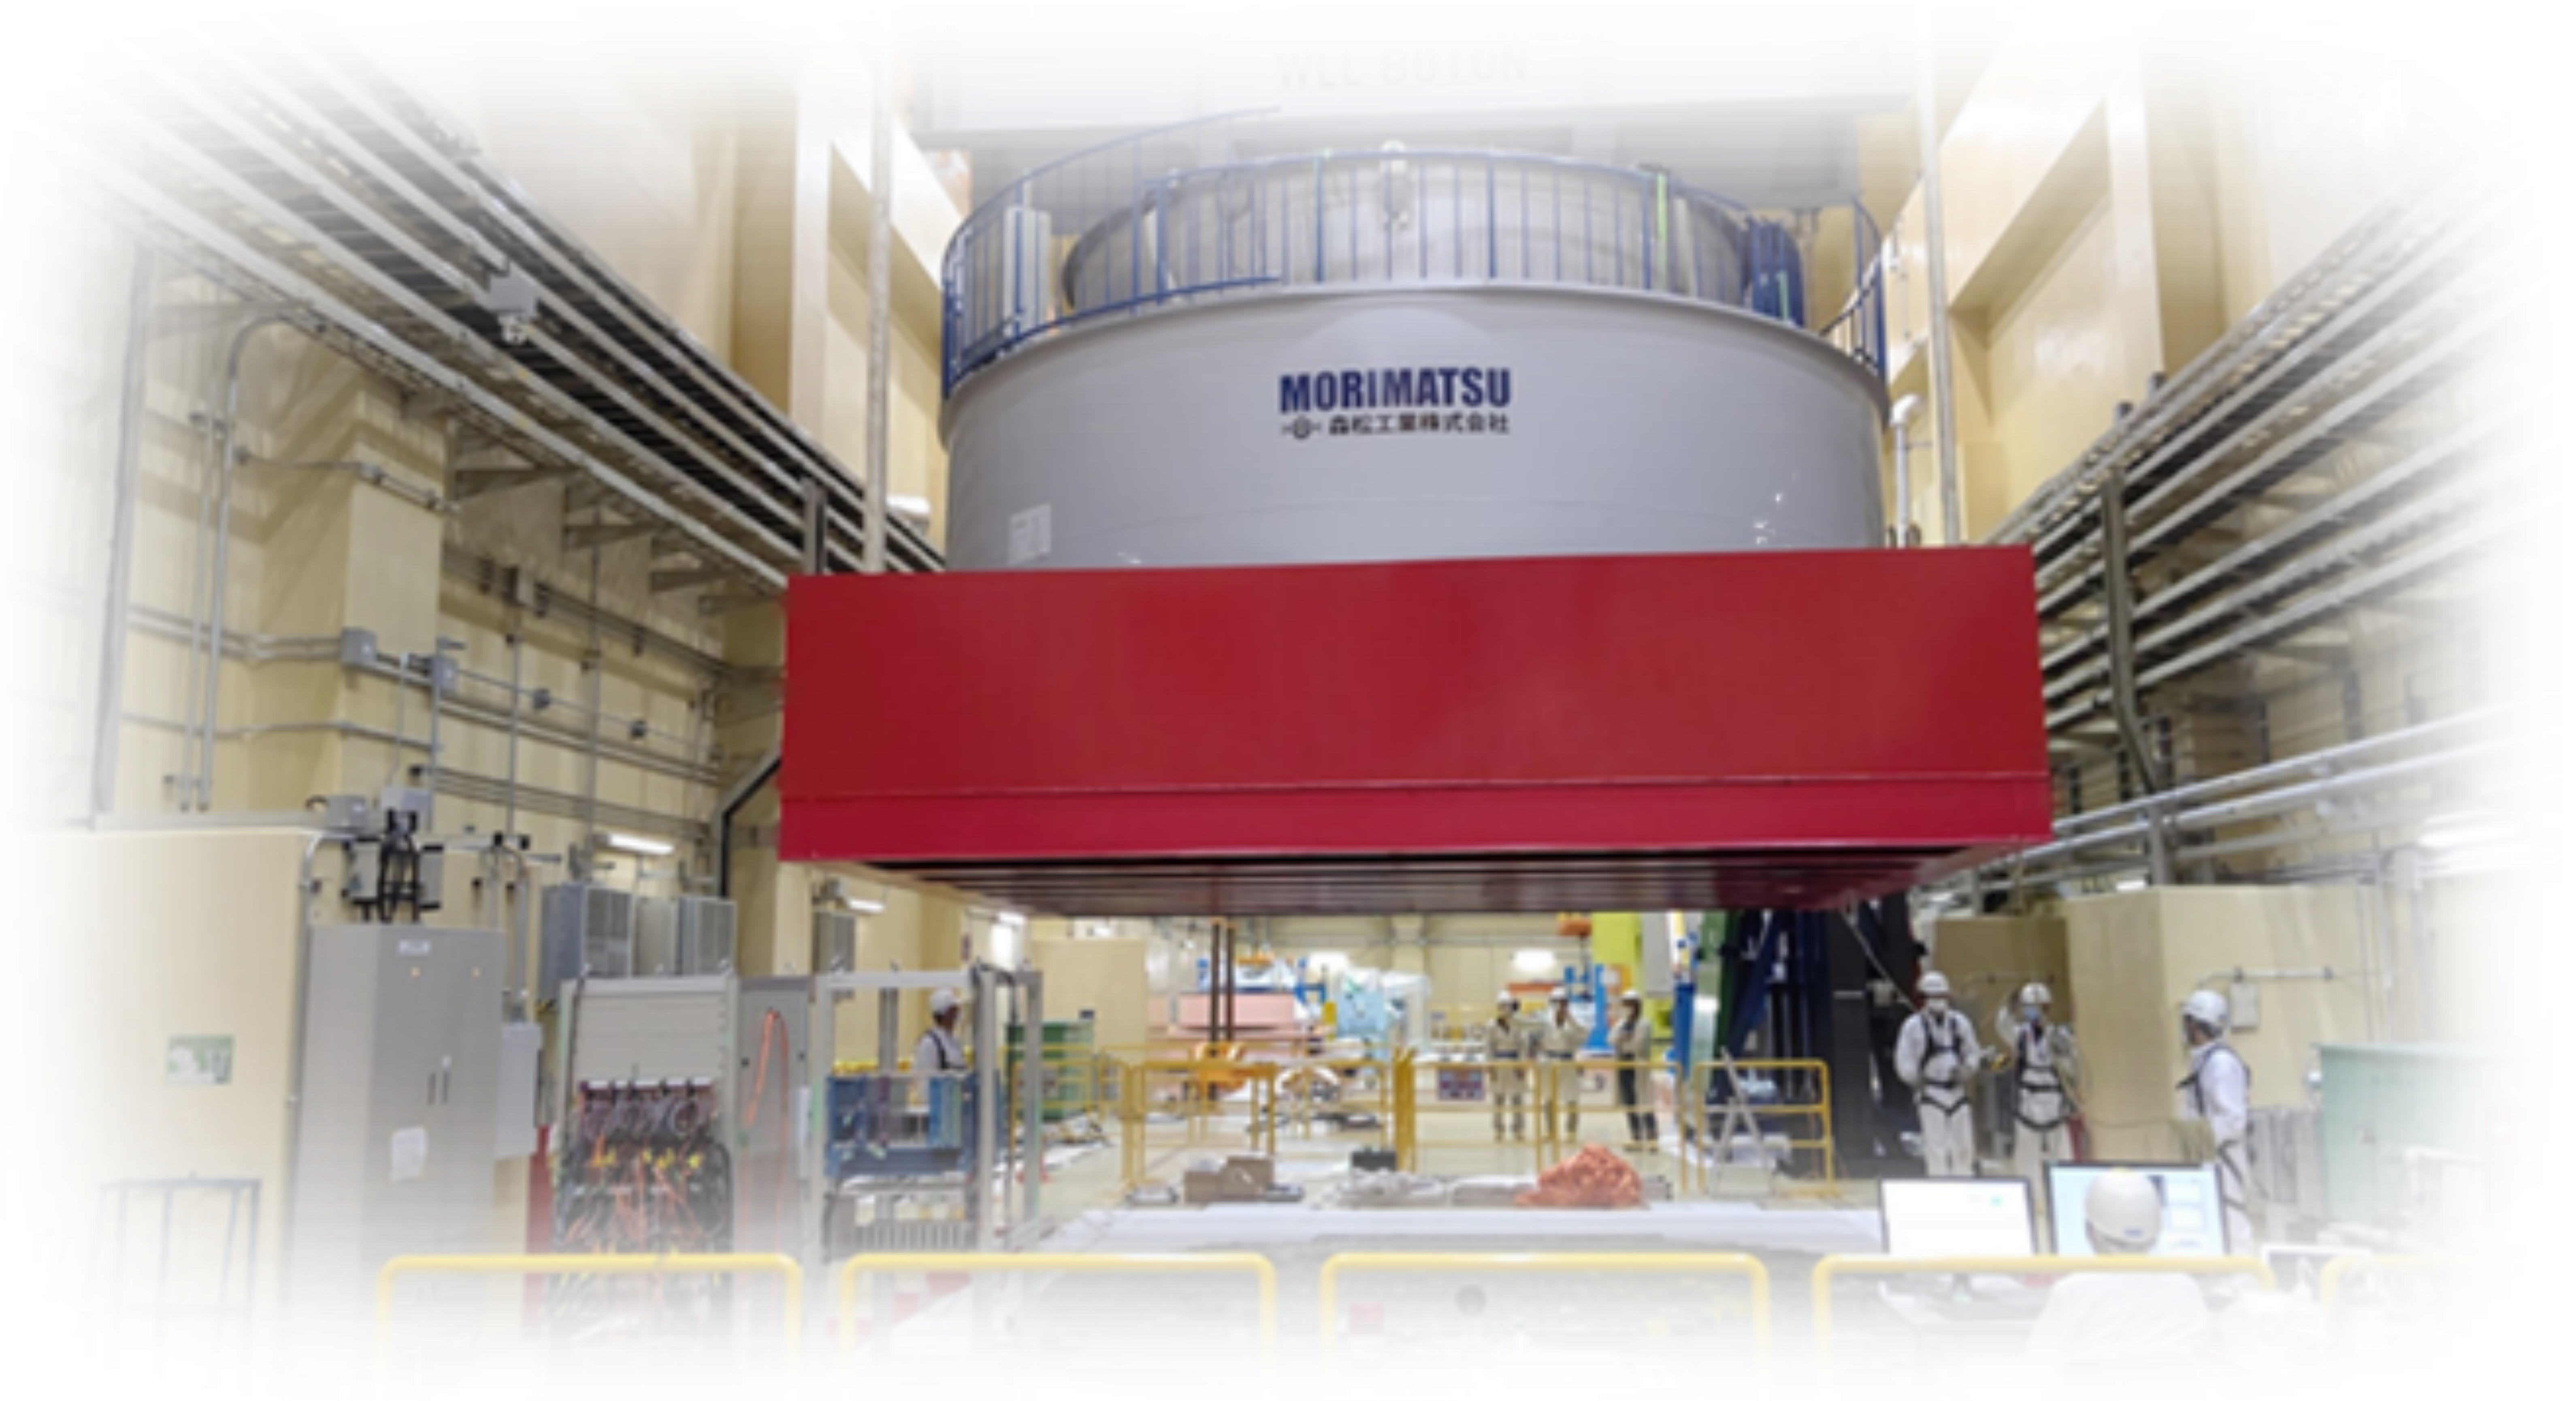
	2021				2022				2023				2024			
	1-3	4-6	7-9	10-12	1-3	4-6	7-9	10-12	1-3	4-6	7-9	10-12	1-3	4-6	7-9	10-12
s.s.tank			bid	Construction												
Acrylic Vessel						bid	Construction		Trans.	Install						
PMTs				Delivery/ Pre-calib		Attachment										
		DC dismantle/ shipping														
(Gd)LS	Donation		Storage/keep													
Electronics									Delivery							
Filling												Filling				
Data taking												Data taking				

Delivery was delayed to the end of June, but it does not affect the overall schedule

Summary

- **JSNS^2 is working toward first precise KDAR measurement**
  - **Clearly see the high purity KDAR signal**
- There have been 1st (2021) and 2nd (2022, ongoing) long physics runs in JSNS^2.
- Analyses are ongoing with the data.
  - Has been developing two separate PSD tools
  - Sterile neutrino search is on-going according to the roadmap
- Based on the JSNS^2 data, JSNS^2-II has been granted.
- Even under the COVID-19, the overall schedule was well followed from 2021’s plan.
- JSNS^2-II expects to start data taking at around the end of 2023.

Thank you for your attention



acknowledgements:

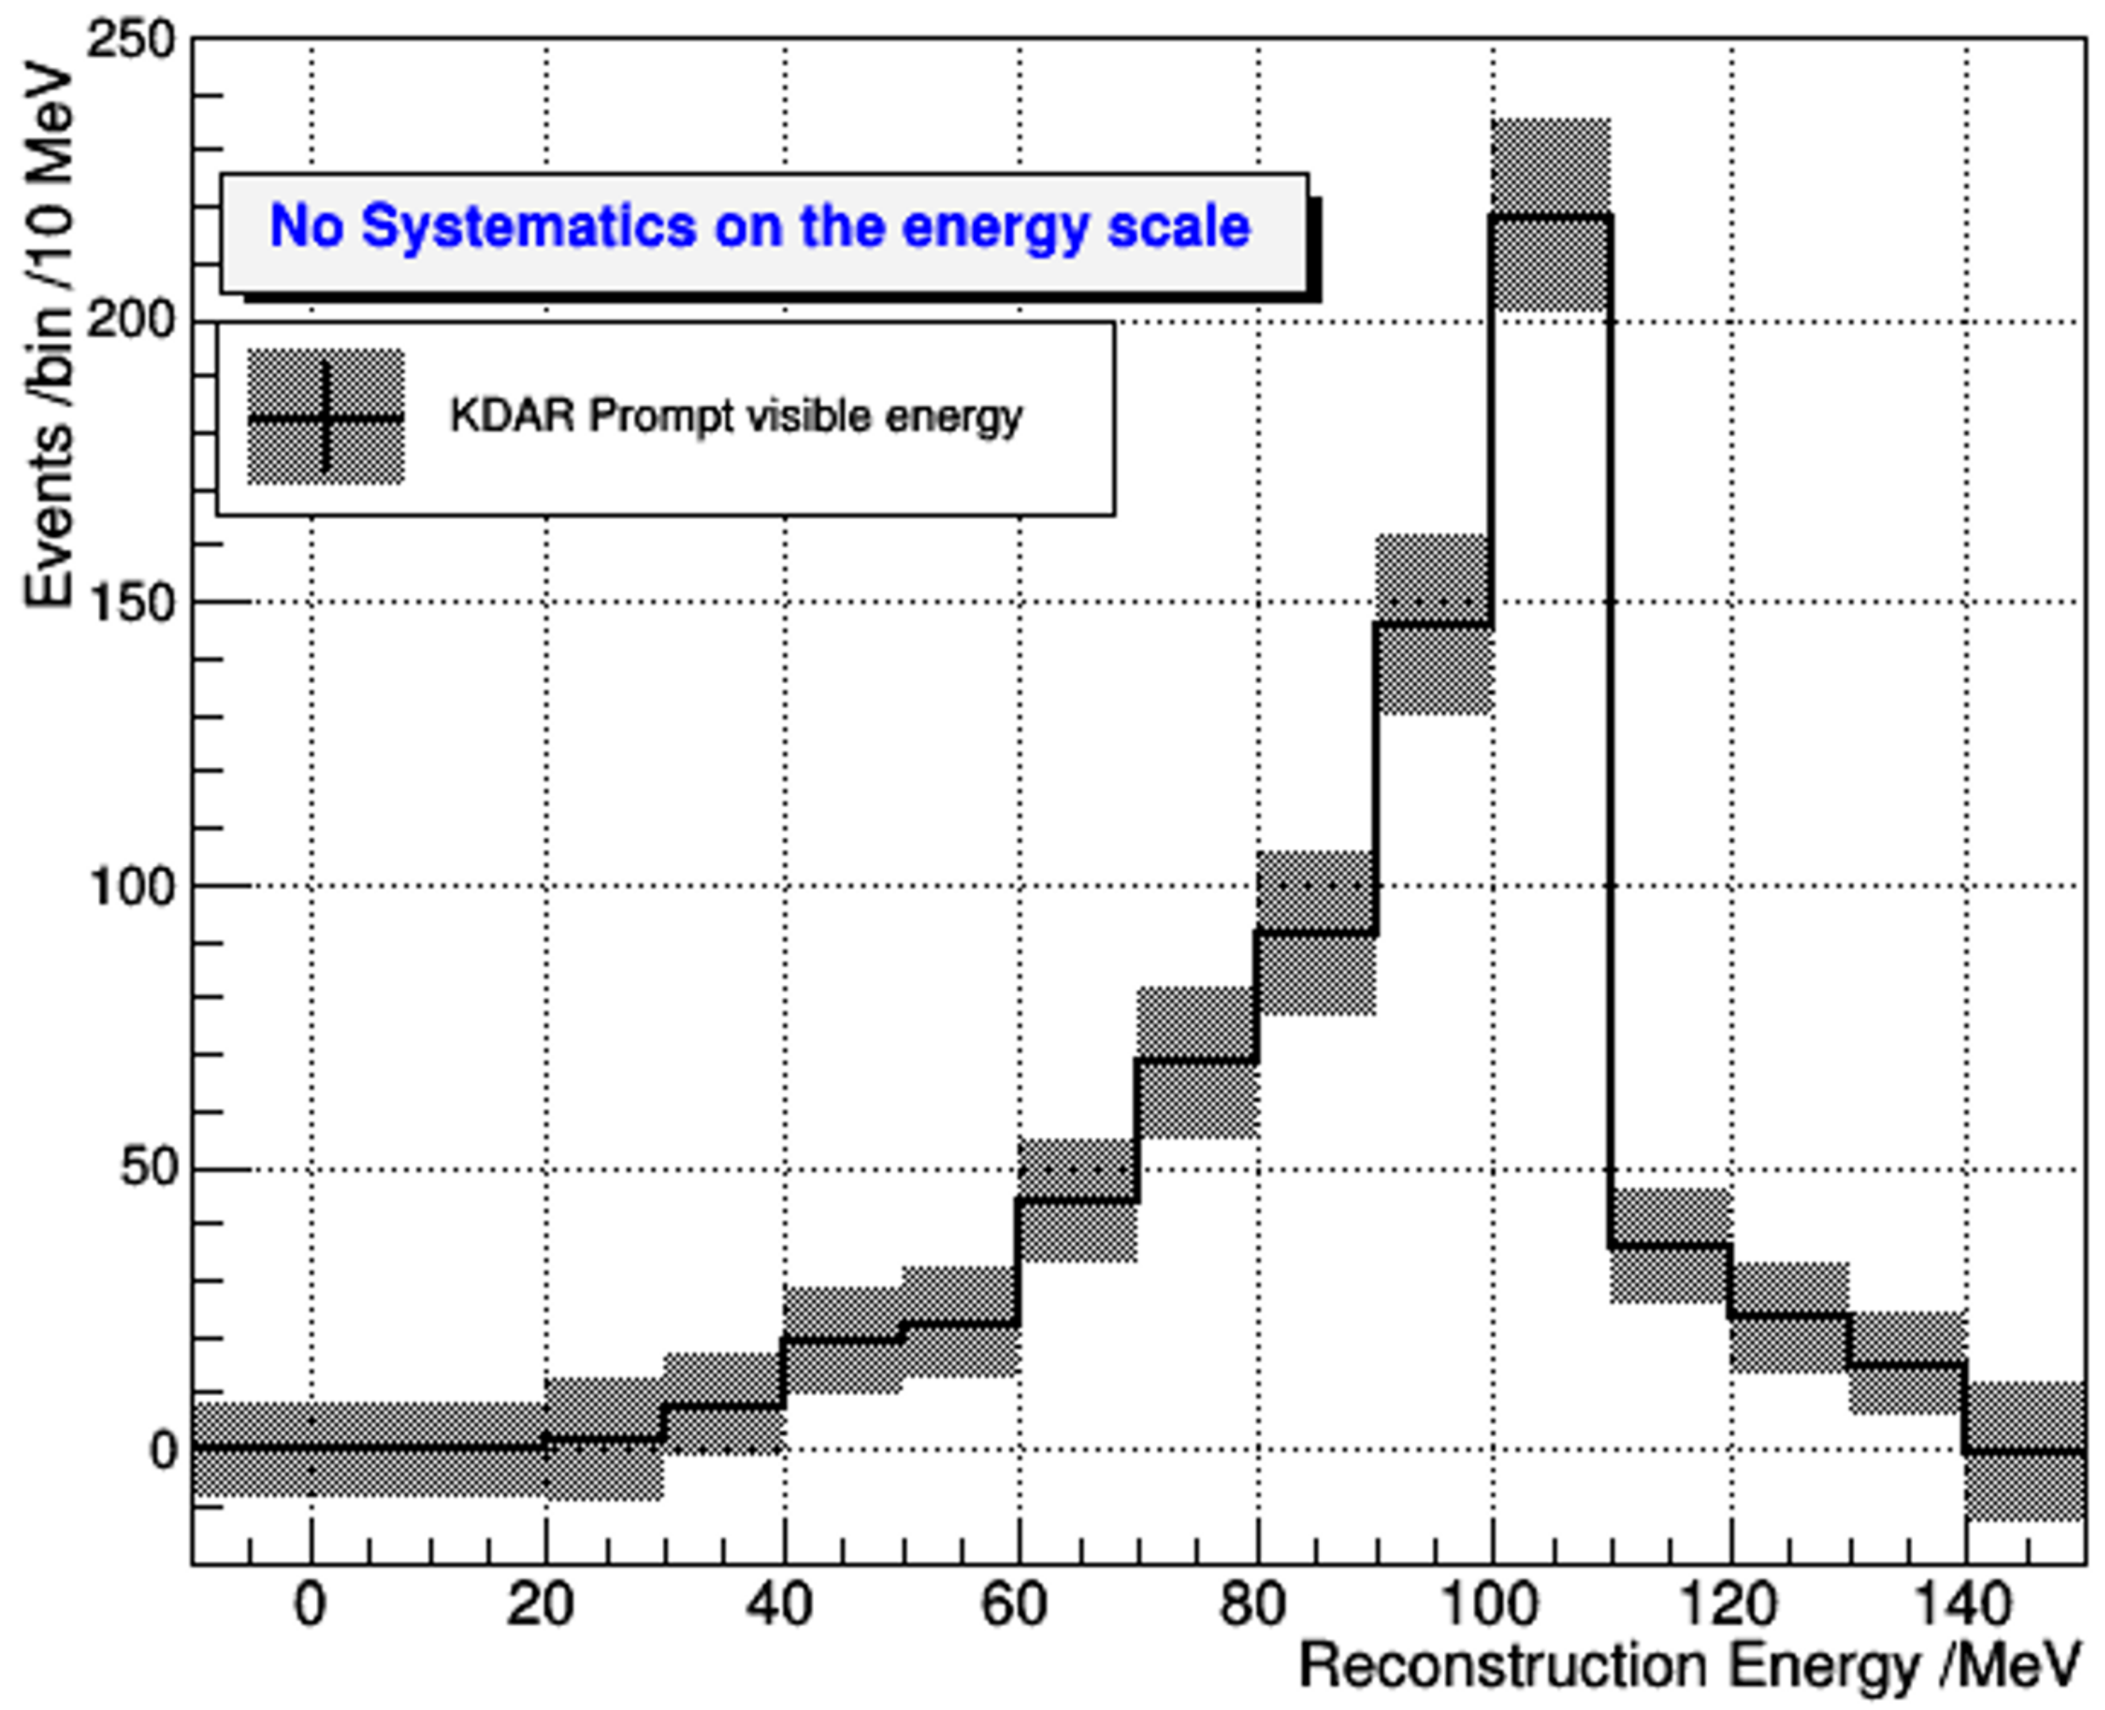
- Royal Society (UK)

KDAR summary slide

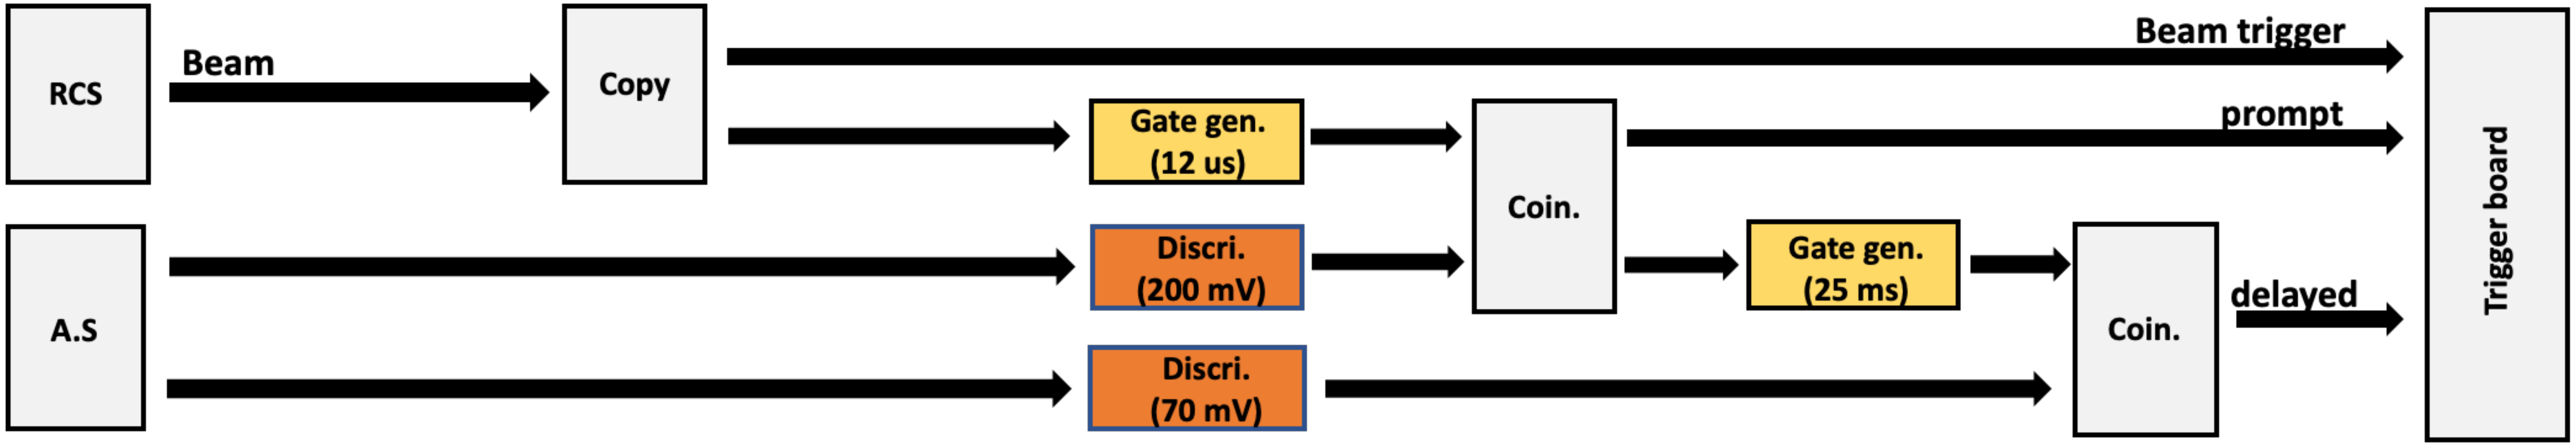


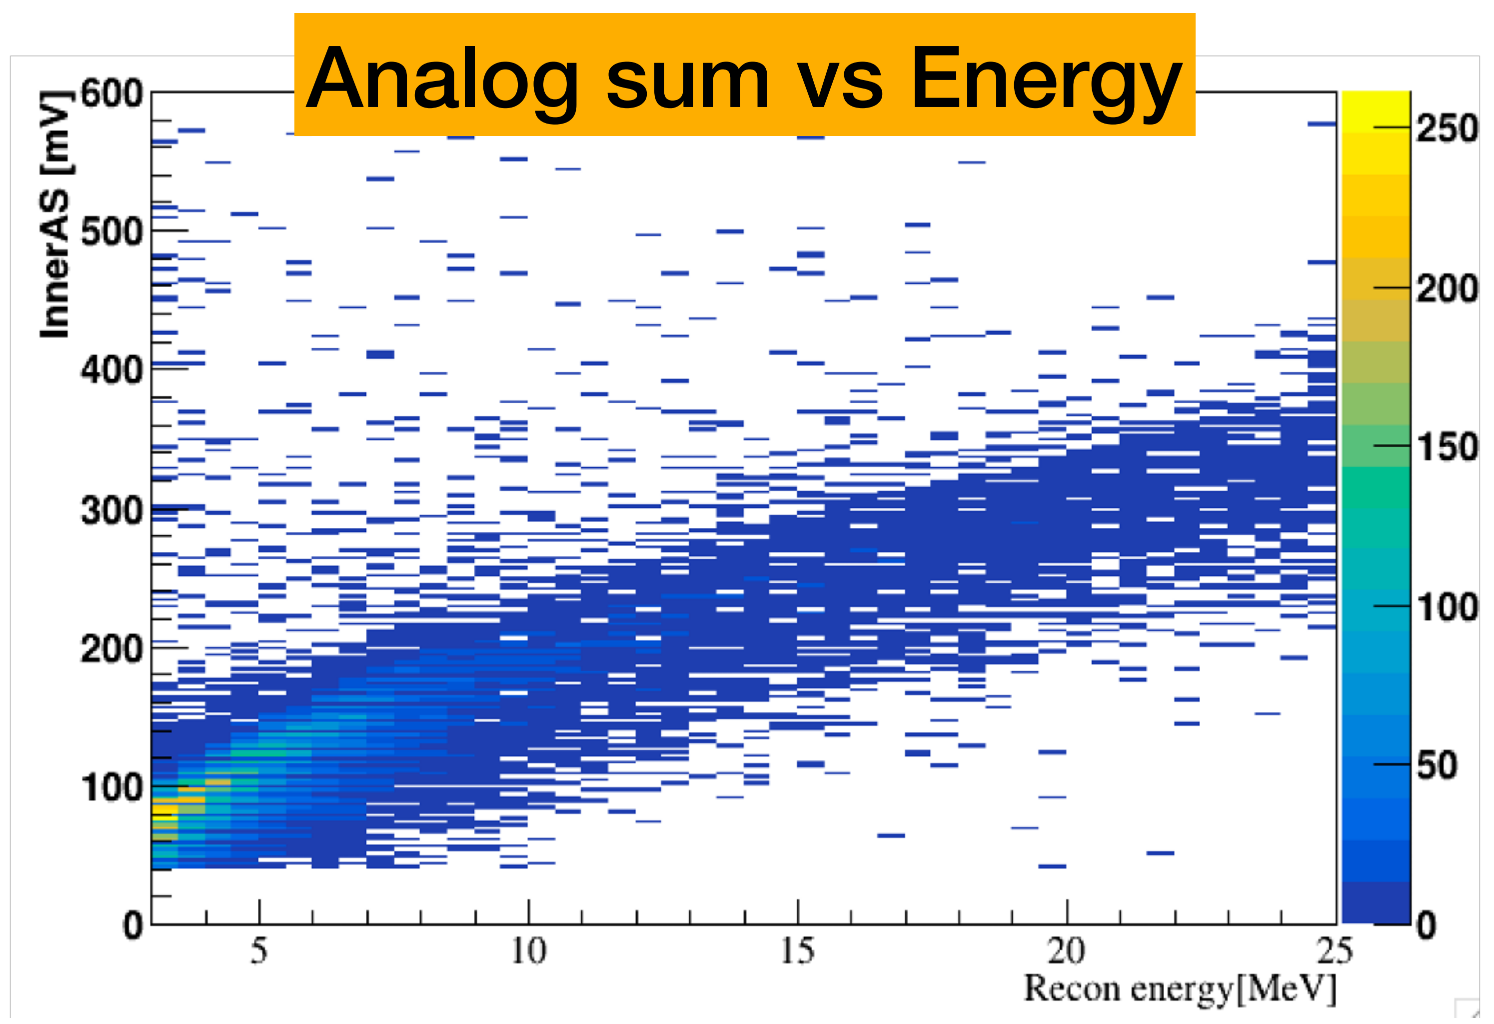
- JSNS2 clearly observes a high purity (95%) KDAR signal!
- This signal will provide the first precision measurement of KDAR neutrinos!
- Working towards finalizing visible energy $(T_\mu + \sum T_p)$ spectrum measurement and detailed model comparison.
  - Will elucidate the difficult to model neutrino-nucleon to neutrino-nucleus transition region, highly relevant across many aspects of neutrino physics

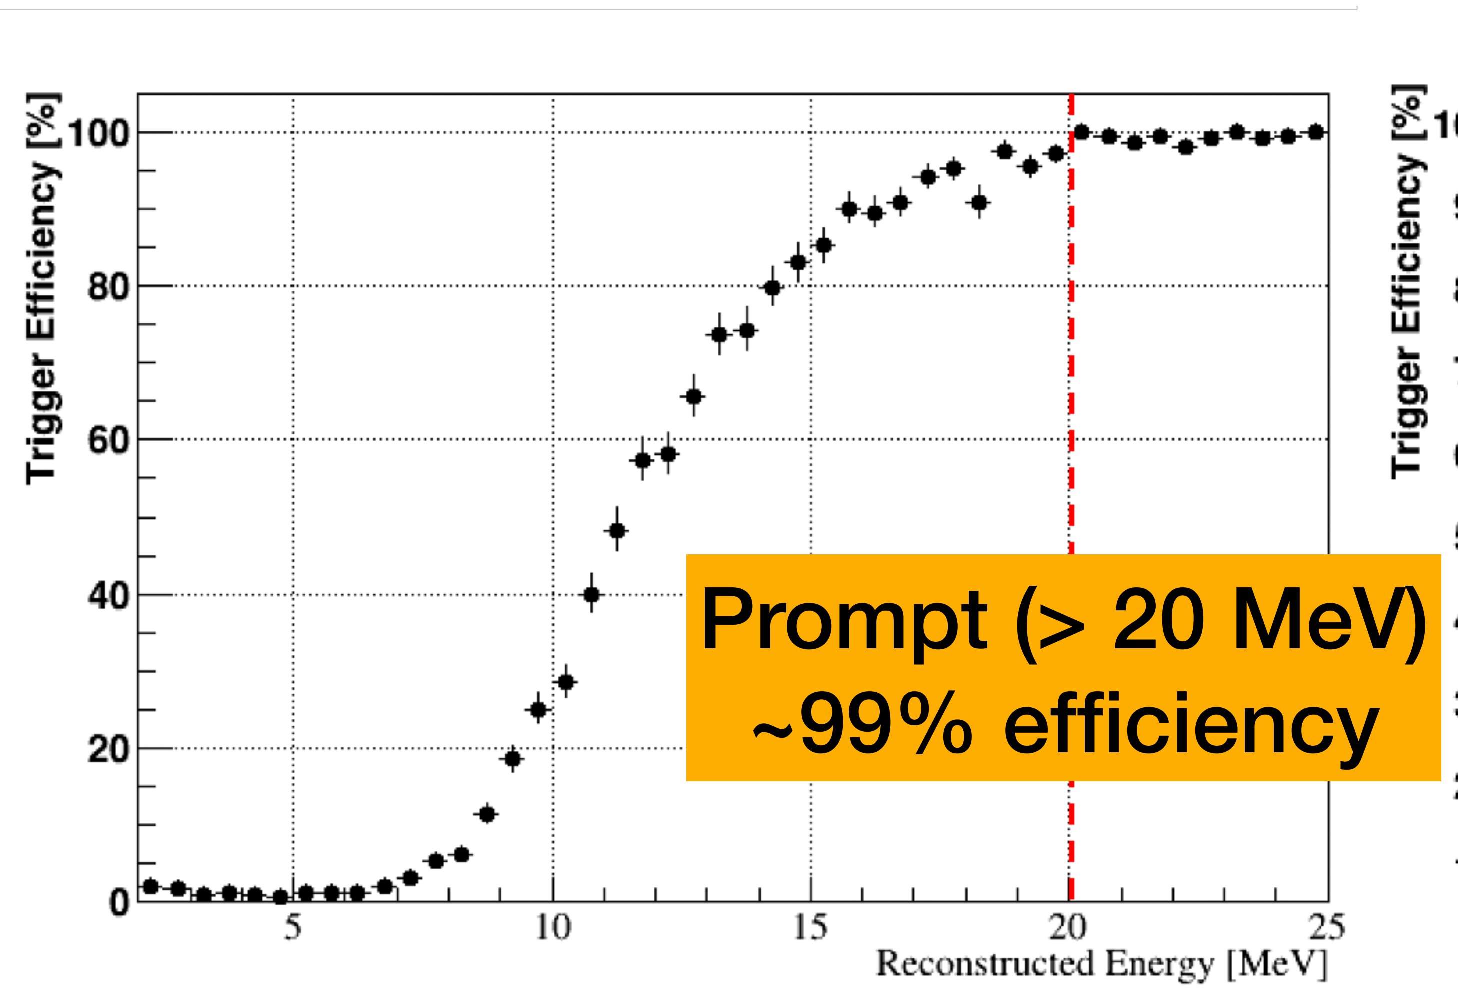
Backup

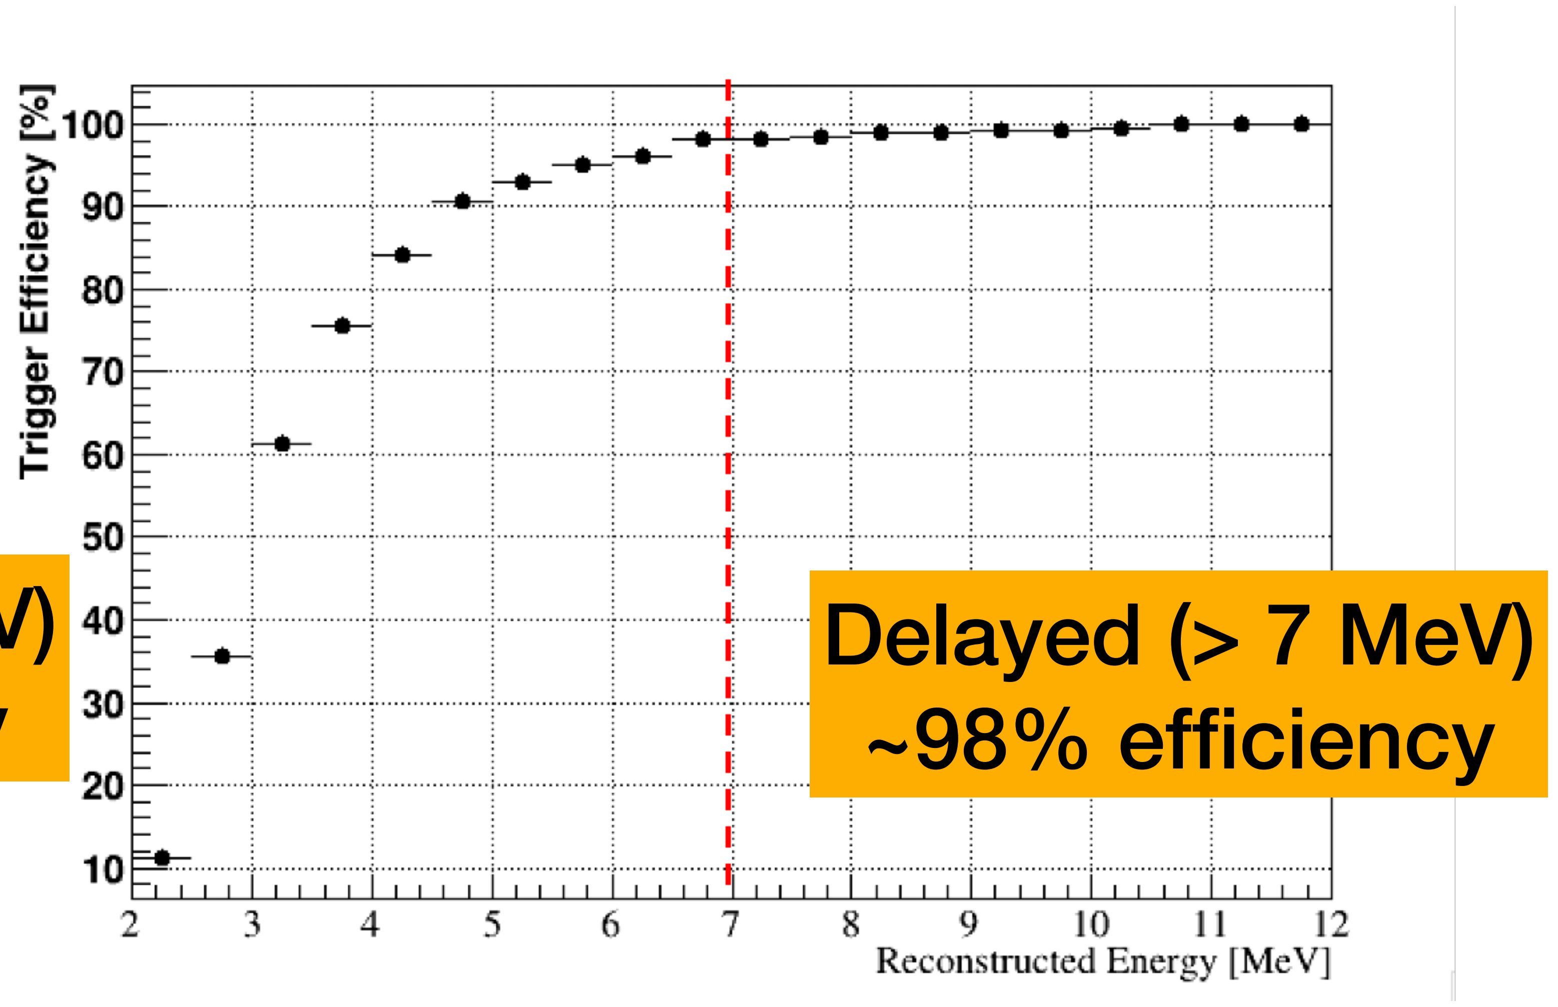
Dedicated sterile trigger

(Conditional and sequential of beam and self trigger)



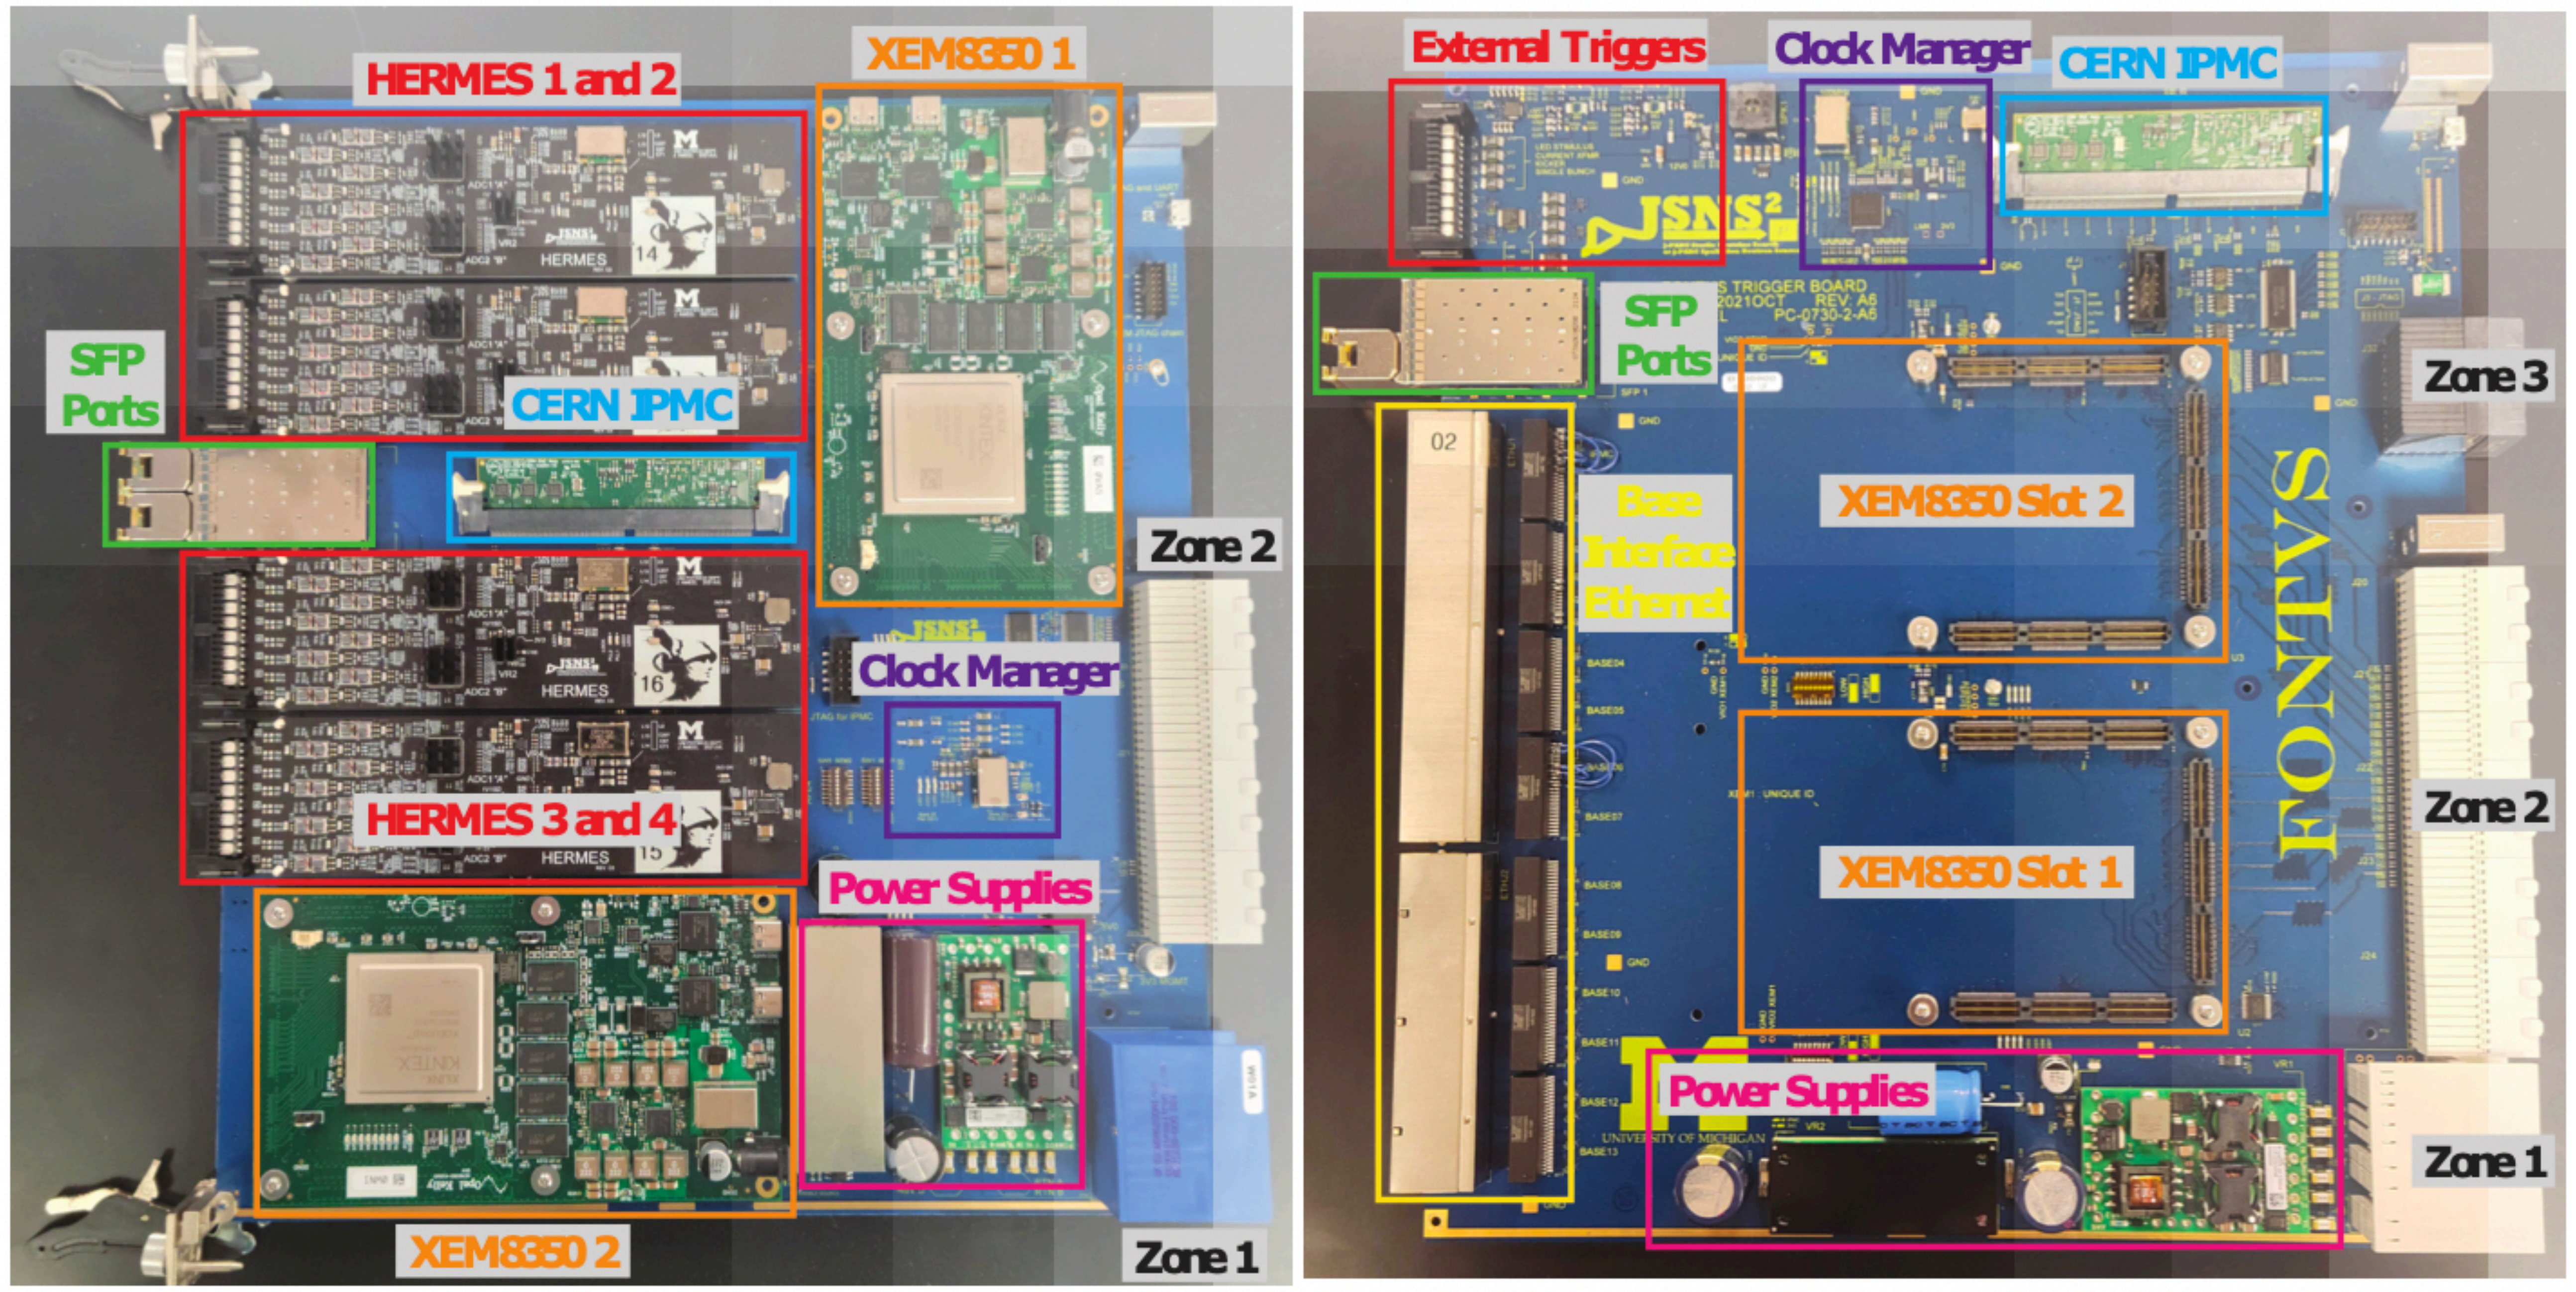


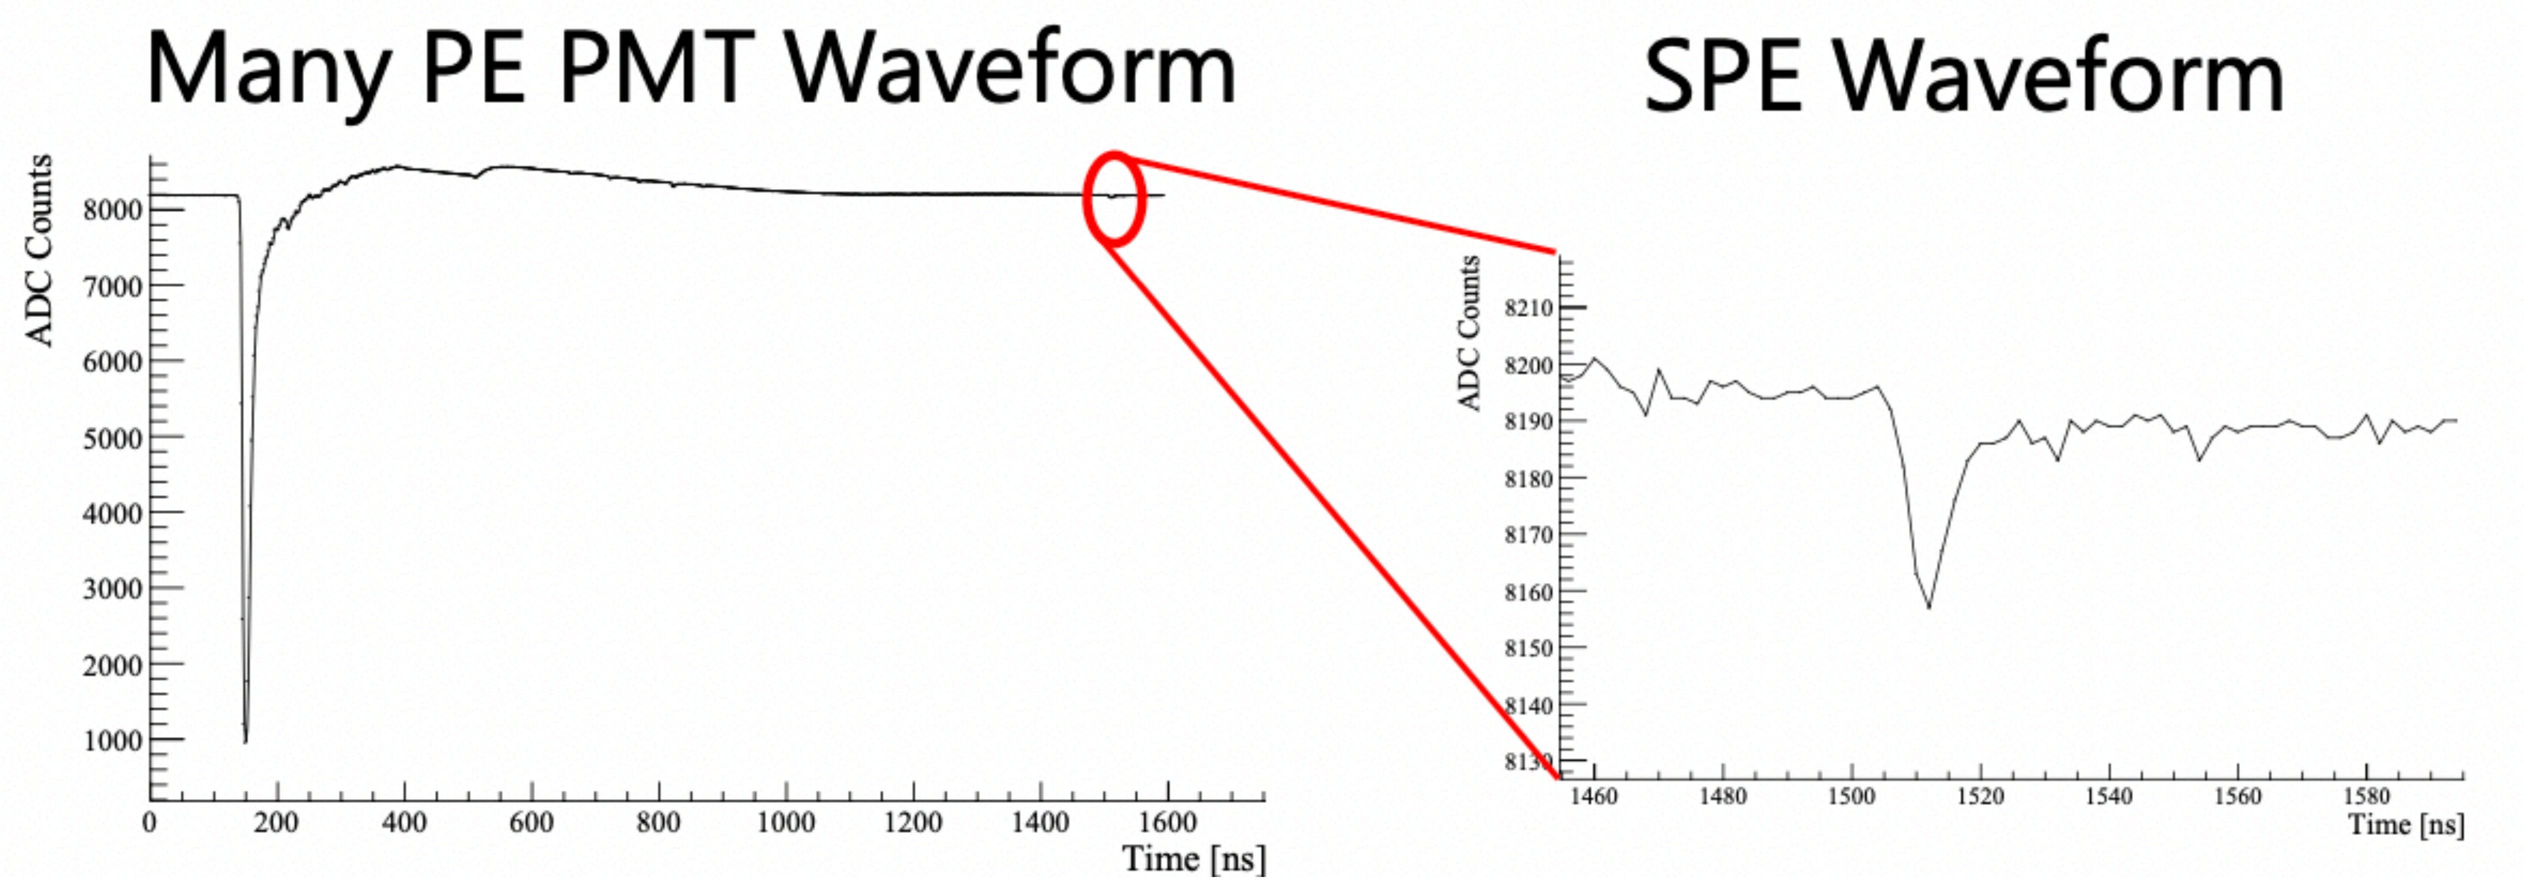


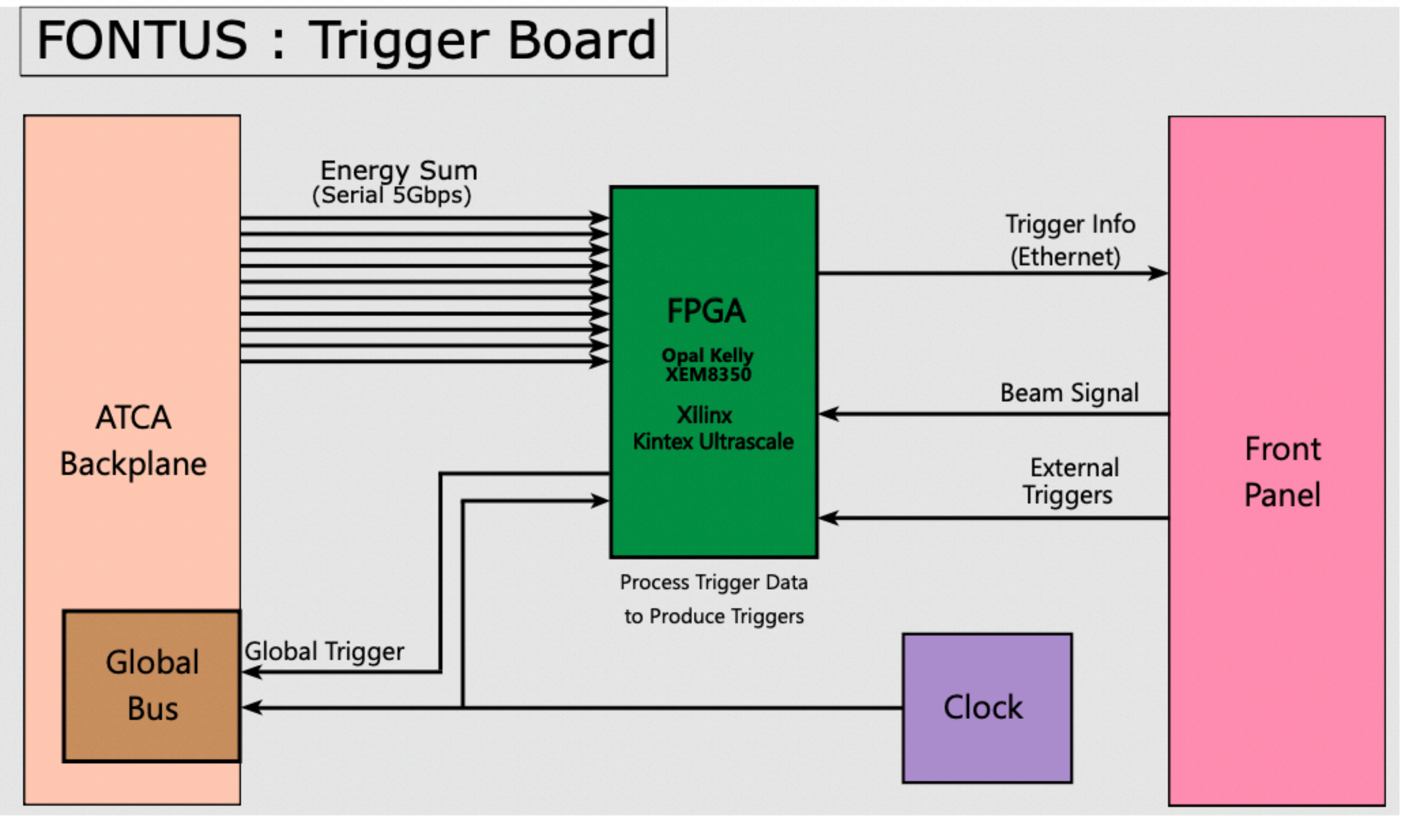


Electronics upgrade
(Under developing)

- The goal is to provide excellent efficiency and resolution over a wide energy range
- FPGA based trigger
- Hosted by an ATCA shelf
- A combined test has been done







$JSNS^2$ vs. LSND

	LSND	$JSNS^2$	Advantage of $JSNS^2$
Detector Mass	167 Tons	17 Tons	
Baseline	30 m	24 m	
Beam Kinetic Energy	0.8 GeV	3.0 GeV	**Allows for KDAR measurement / 10 times higher pion production**
Beam Power	0.8 MW	1.0 MW (designed)	**More intense beam**
Beam Pulse	600 us, 120 Hz	100 ns (x2), 25 Hz	**300 times less steady-state background for BID**
Capture Nucleus	H (2.2 MeV)	Gd (~8 MeV)	**Shorter capture time, higher signal to ratio**
