

Study of Tracks originated in the LAr volume of GRAIN

17/6/22

AIM OF THE ANALYSIS

- Composition and materials of GRAIN are still under discussion.
- The purpose of this analysis is the study of the stopping power for the GRAIN cryostat vessels

SIMULATIONS

- Neutrinos energy spectrum from FHC LBNF beam
- 90k $\nu_{\mu}(\nu_e)$ – *Ar* interactions generated with GENIE (v.2) in the LAr volume of GRAIN
- Final state particles propagated through SAND with EDepSim

GRAIN "VERSION 2"

* INTERNAL VESSEL ENDCAPS 16 mm

* 90k interactions generated in the LAr volume

ALL TRACKS (primary, secondary, charged and neutral)

$\nu_\mu - Ar$ interactions

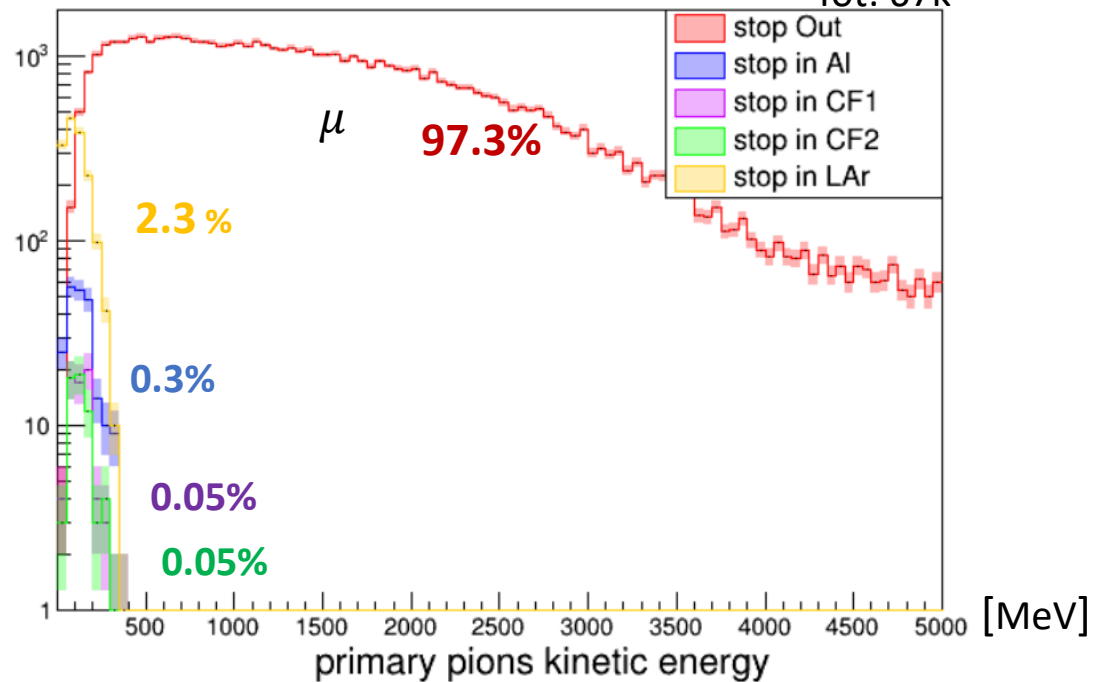

particles stopping volume

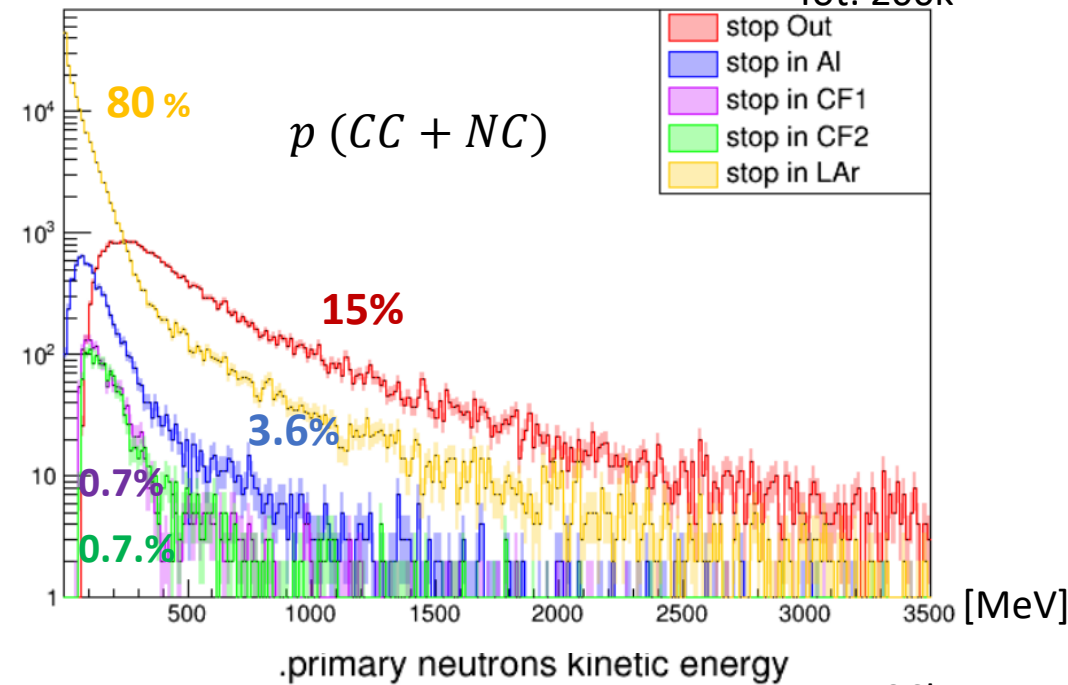

primary muons kinetic energy

Tot: 67k

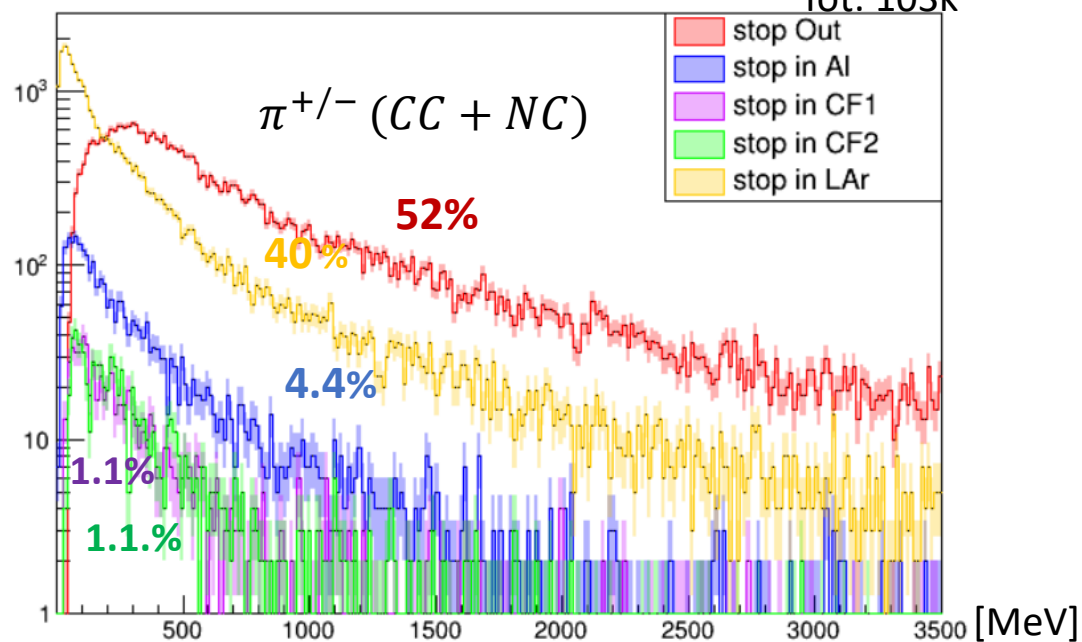

primary protons kinetic energy

Tot: 200k

primary pions kinetic energy

Tot: 103k

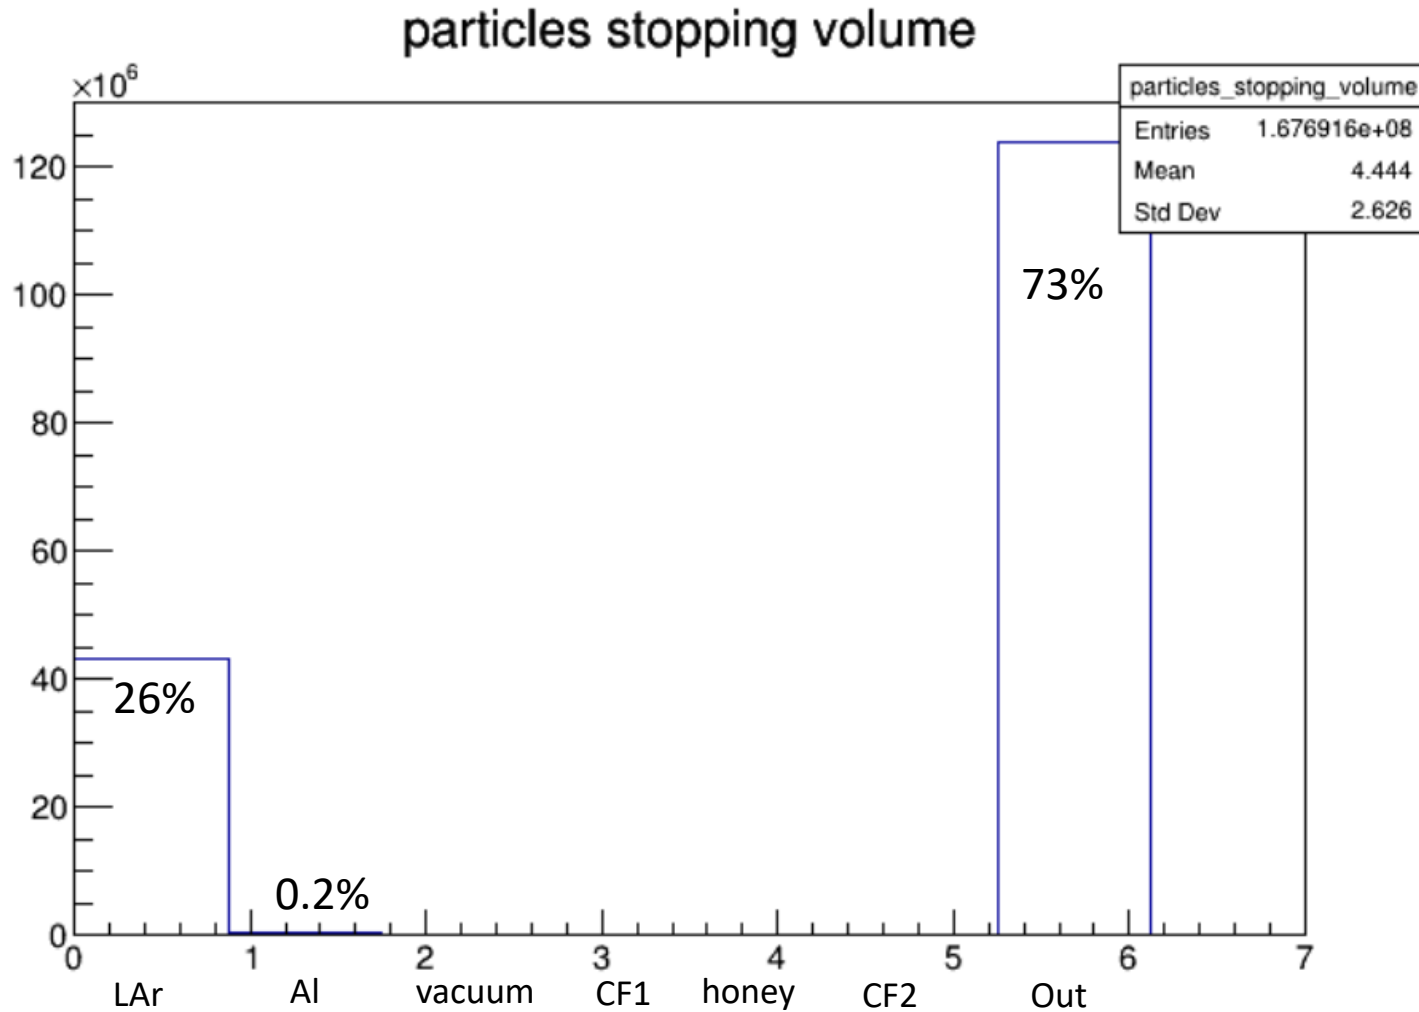

primary neutrons kinetic energy

Tot: 186k

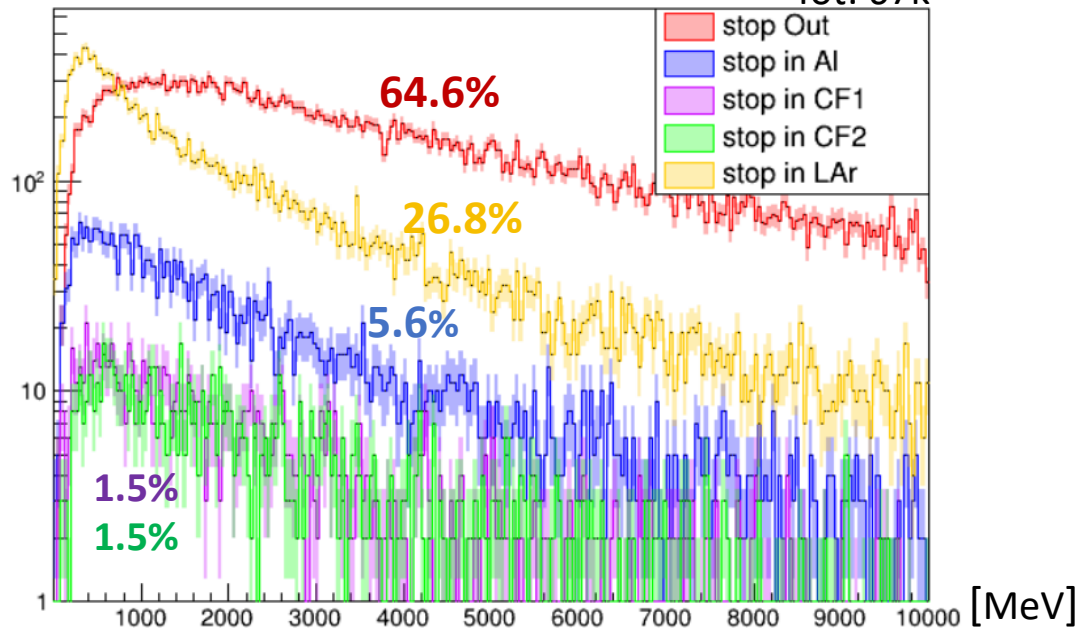

ALL TRACKS (primary, secondary, charged and neutral)

$\nu_e - Ar$ interactions

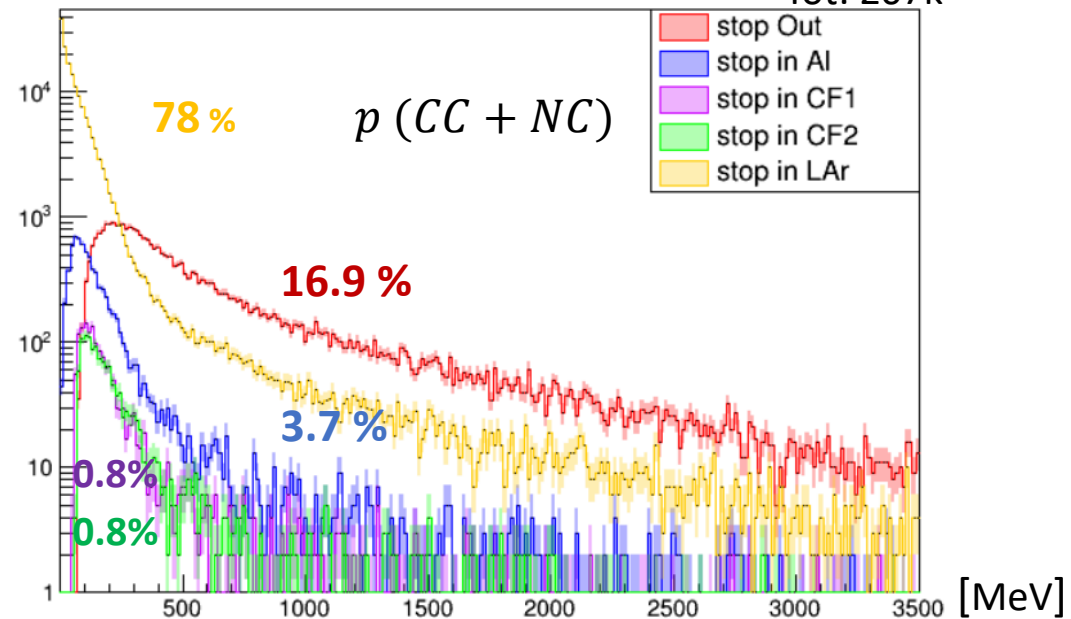

primary electrons energy

Tot: 67k

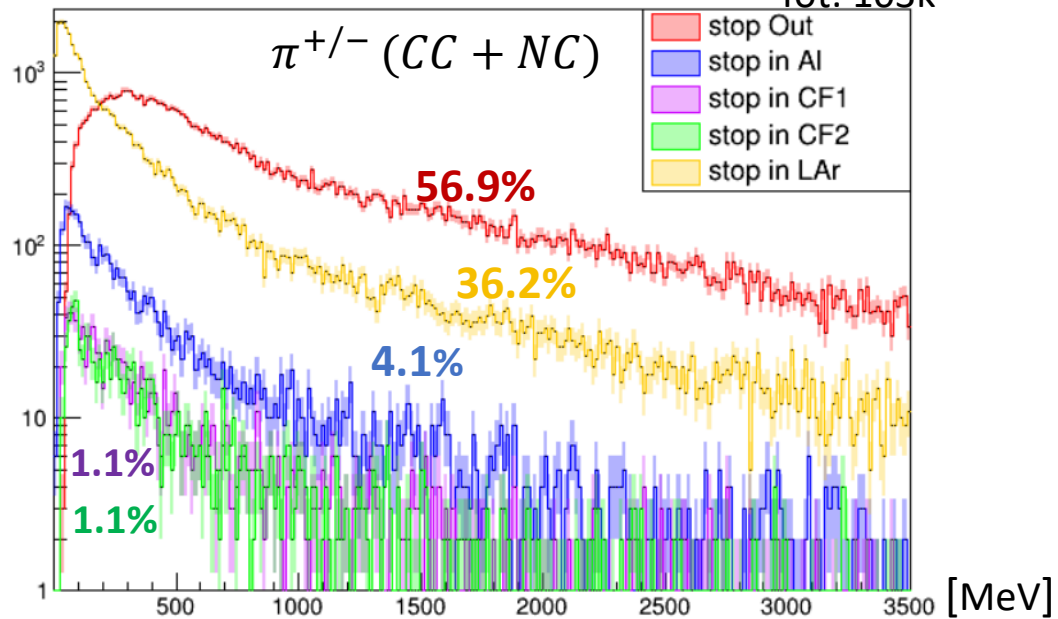

primary protons kinetic energy

Tot: 207k

primary pions kinetic energy

Tot: 103k

primary neutrons kinetic energy

Tot: 67k

Outlook

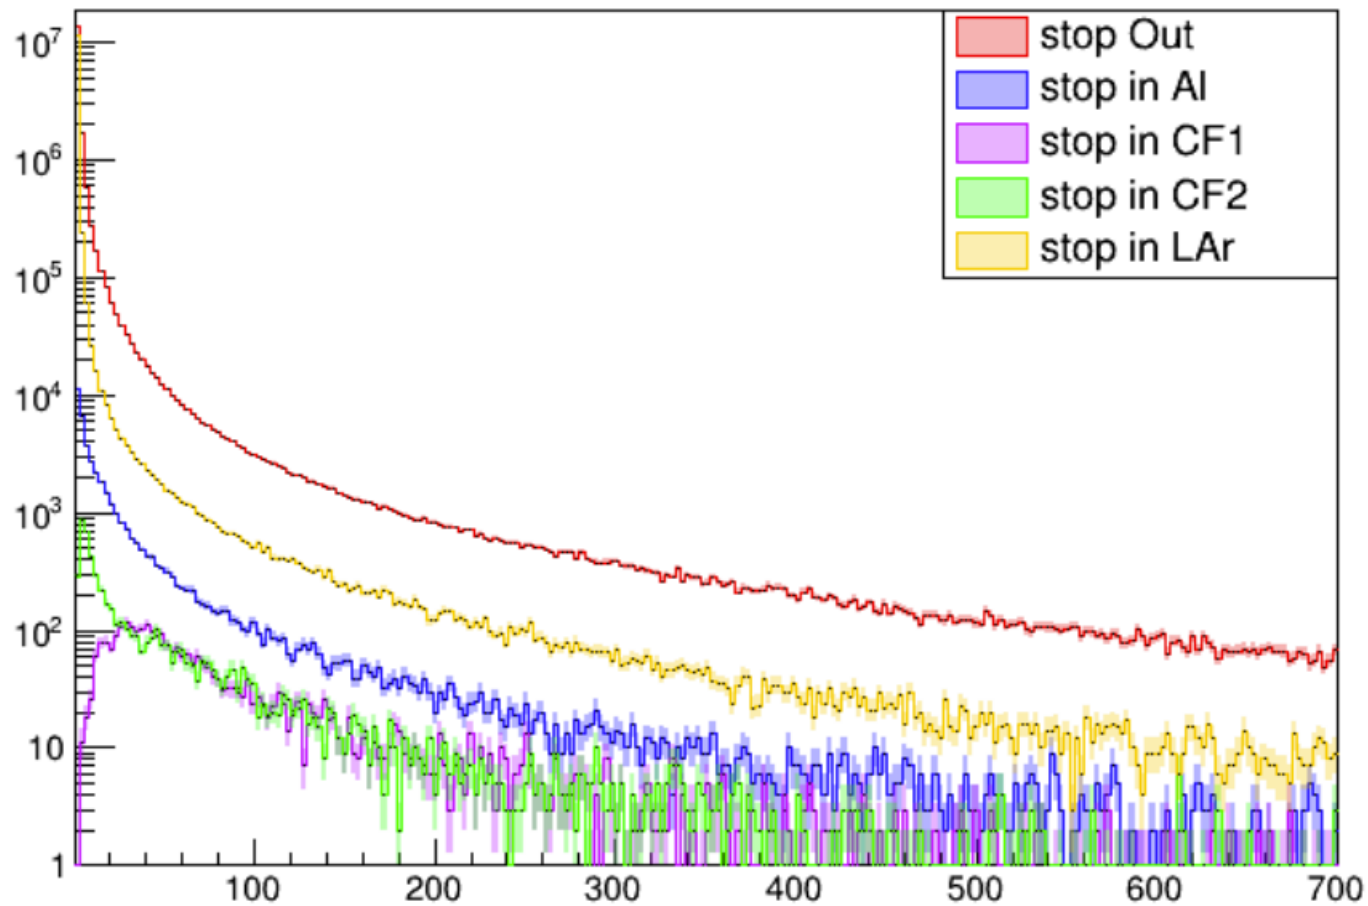

$\nu_{\mu} - Ar$ int.	LAr	Al vessel	CF vessels	Out of GRAIN
μ	2.3 %	0.3 %	0.1 %	97.3%
Primary p	80 %	3.6 %	1.4 %	15 %
Primary n	40 %	4.4 %	2.2 %	52 %
Primary $\pi^{+/-}$	40 %	4.2 %	2.2 %	54 %

$\nu_e - Ar$ int	LAr	Al vessel	CF vessels	Out of GRAIN
e	26.8 %	5.6 %	3 %	64.6 %
Primary p	78 %	3.7 %	1.6 %	16.9 %
Primary n	38.7 %	4.1 %	2.2 %	56.9 %
Primary $\pi^{+/-}$	36.2 %	4.1 %	2.2 %	55.1 %
