

ProtoDUNE Update

Leigh Whitehead

5th July 2022

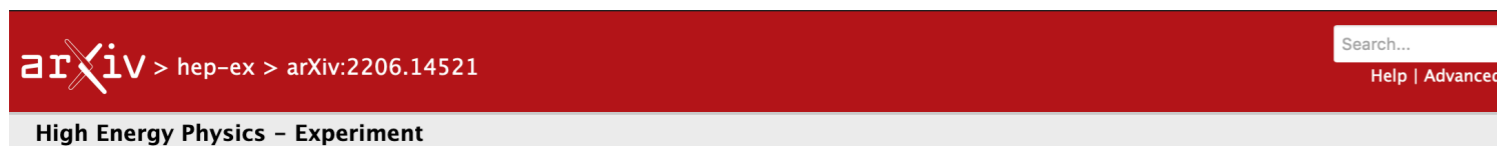

DUNE UK Meeting

Introduction

- ProtoDUNE is now a rather ambiguous name
 - We have three detectors to think about!
- ProtoDUNE-SP
- ProtoDUNE-HD
- ProtoDUNE-VD
- The event reconstruction for all three of these detectors falls under DUNE's ProtoDUNE DRA physics group
 - Convenors: Tingjun Yang and Leigh Whitehead
 - ProtoDUNE-HD Offline Coordinator: Jake Calcutt

ProtoDUNE-SP

- As far as the event reconstruction goes, we can consider ProtoDUNE-SP as finished
 - Final data production was done last year, no plans for reprocessing
 - Comprehensive paper written and posted to the arXiv (finally!)
 - Now submitted to EPJC - let's hope for a smooth review process

[Submitted on 29 Jun 2022]

Reconstruction of interactions in the ProtoDUNE-SP detector with Pandora

The Pandora Software Development Kit and algorithm libraries provide pattern-recognition logic essential to the reconstruction of particle interactions in liquid argon time projection chamber detectors. Pandora is the primary event reconstruction software used at ProtoDUNE-SP, a prototype for the Deep Underground Neutrino Experiment far detector. ProtoDUNE-SP, located at CERN, is exposed to a charged-particle test beam. This paper gives an overview of the Pandora reconstruction algorithms and how they have been tailored for use at ProtoDUNE-SP. In complex events with numerous cosmic-ray and beam background particles, the simulated reconstruction and identification efficiency for triggered test-beam particles is above 80% for the majority of particle type and beam momentum combinations. Specifically, simulated 1 GeV/c charged pions and protons are correctly reconstructed and identified with efficiencies of $86.1 \pm 0.6\%$ and $84.1 \pm 0.6\%$, respectively. The efficiencies measured for test-beam data are shown to be within 5% of those predicted by the simulation.

ProtoDUNE-SP

- ProtoDUNE-HD is the successor to ProtoDUNE-SP
- Key differences for event reconstruction:
 - There are now only four APAs
 - Two will be upside down to test the hanging mechanism for these APAs
 - The APAs start 1.4m farther downstream compared to ProtoDUNE-SP
 - New cold electronics
 - Hopefully this will be a transparent change for the event reconstruction
- The above differences mean the coordinate system has changed
 - Maintain the definition that the bottom of the upstream end of the cathode is the origin
 - The new origin is at (0.0, -7.2, 144.93) in ProtoDUNE-SP coordinates

- ProtoDUNE-HD is the successor to ProtoDUNE-SP
- Key differences for event reconstruction:
 - There are now only four APAs
 - Two will be upside down to test the hanging mechanism for these APAs
 - The APAs start 1.4m farther downstream compared to ProtoDUNE-SP
 - New cold electronics
 - Hopefully this will be a transparent change for the event reconstruction
- Detector should be switched on by the end of October
 - Most likely won't have beam time this year
 - Expected beam will start in May 2023 (after CERN's winter break)
- We still need to be ready for cosmic data in October!

Detector geometry

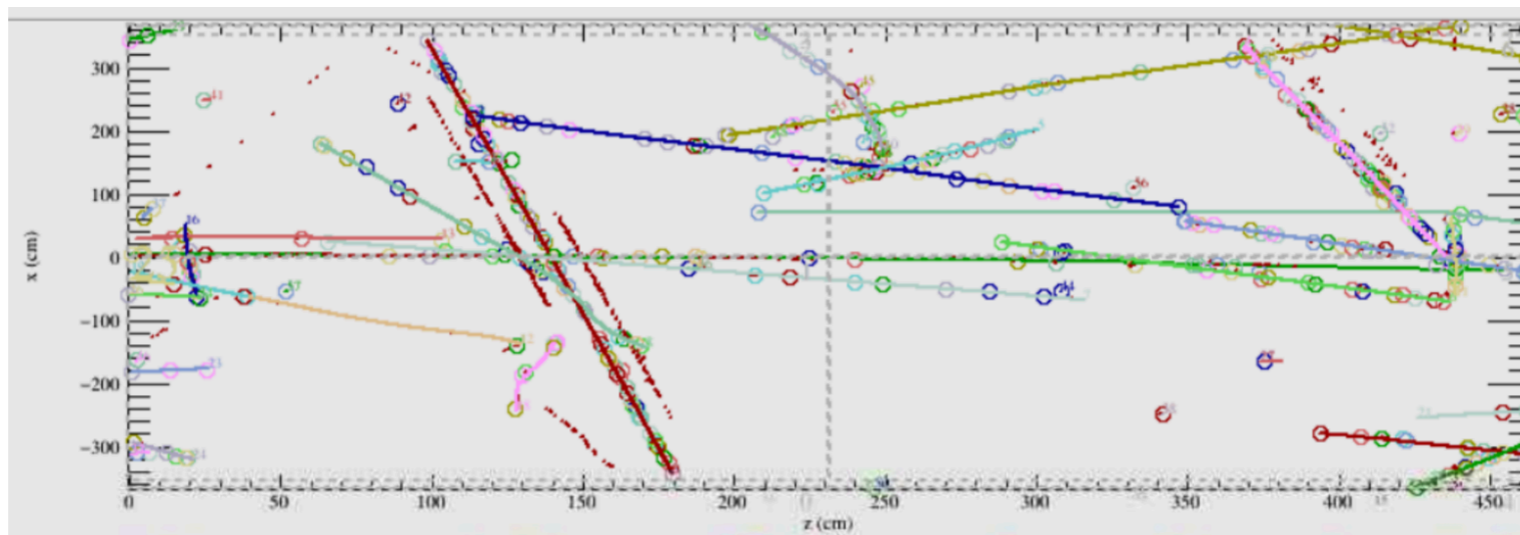

- We have a first version of the geometry in LArSoft now
- It has quite a few missing features, but gives us something to use
 - The two upside-down APAs aren't upside down
 - The beam plug is very approximate but should be in the right place
 - I think the field cage may be incomplete
 - X-ARAPUCAs currently using the old design (from ProtoDUNE-SP)
- Good enough to get started with
 - Detector is roughly the right size and in roughly the right place

Current software status

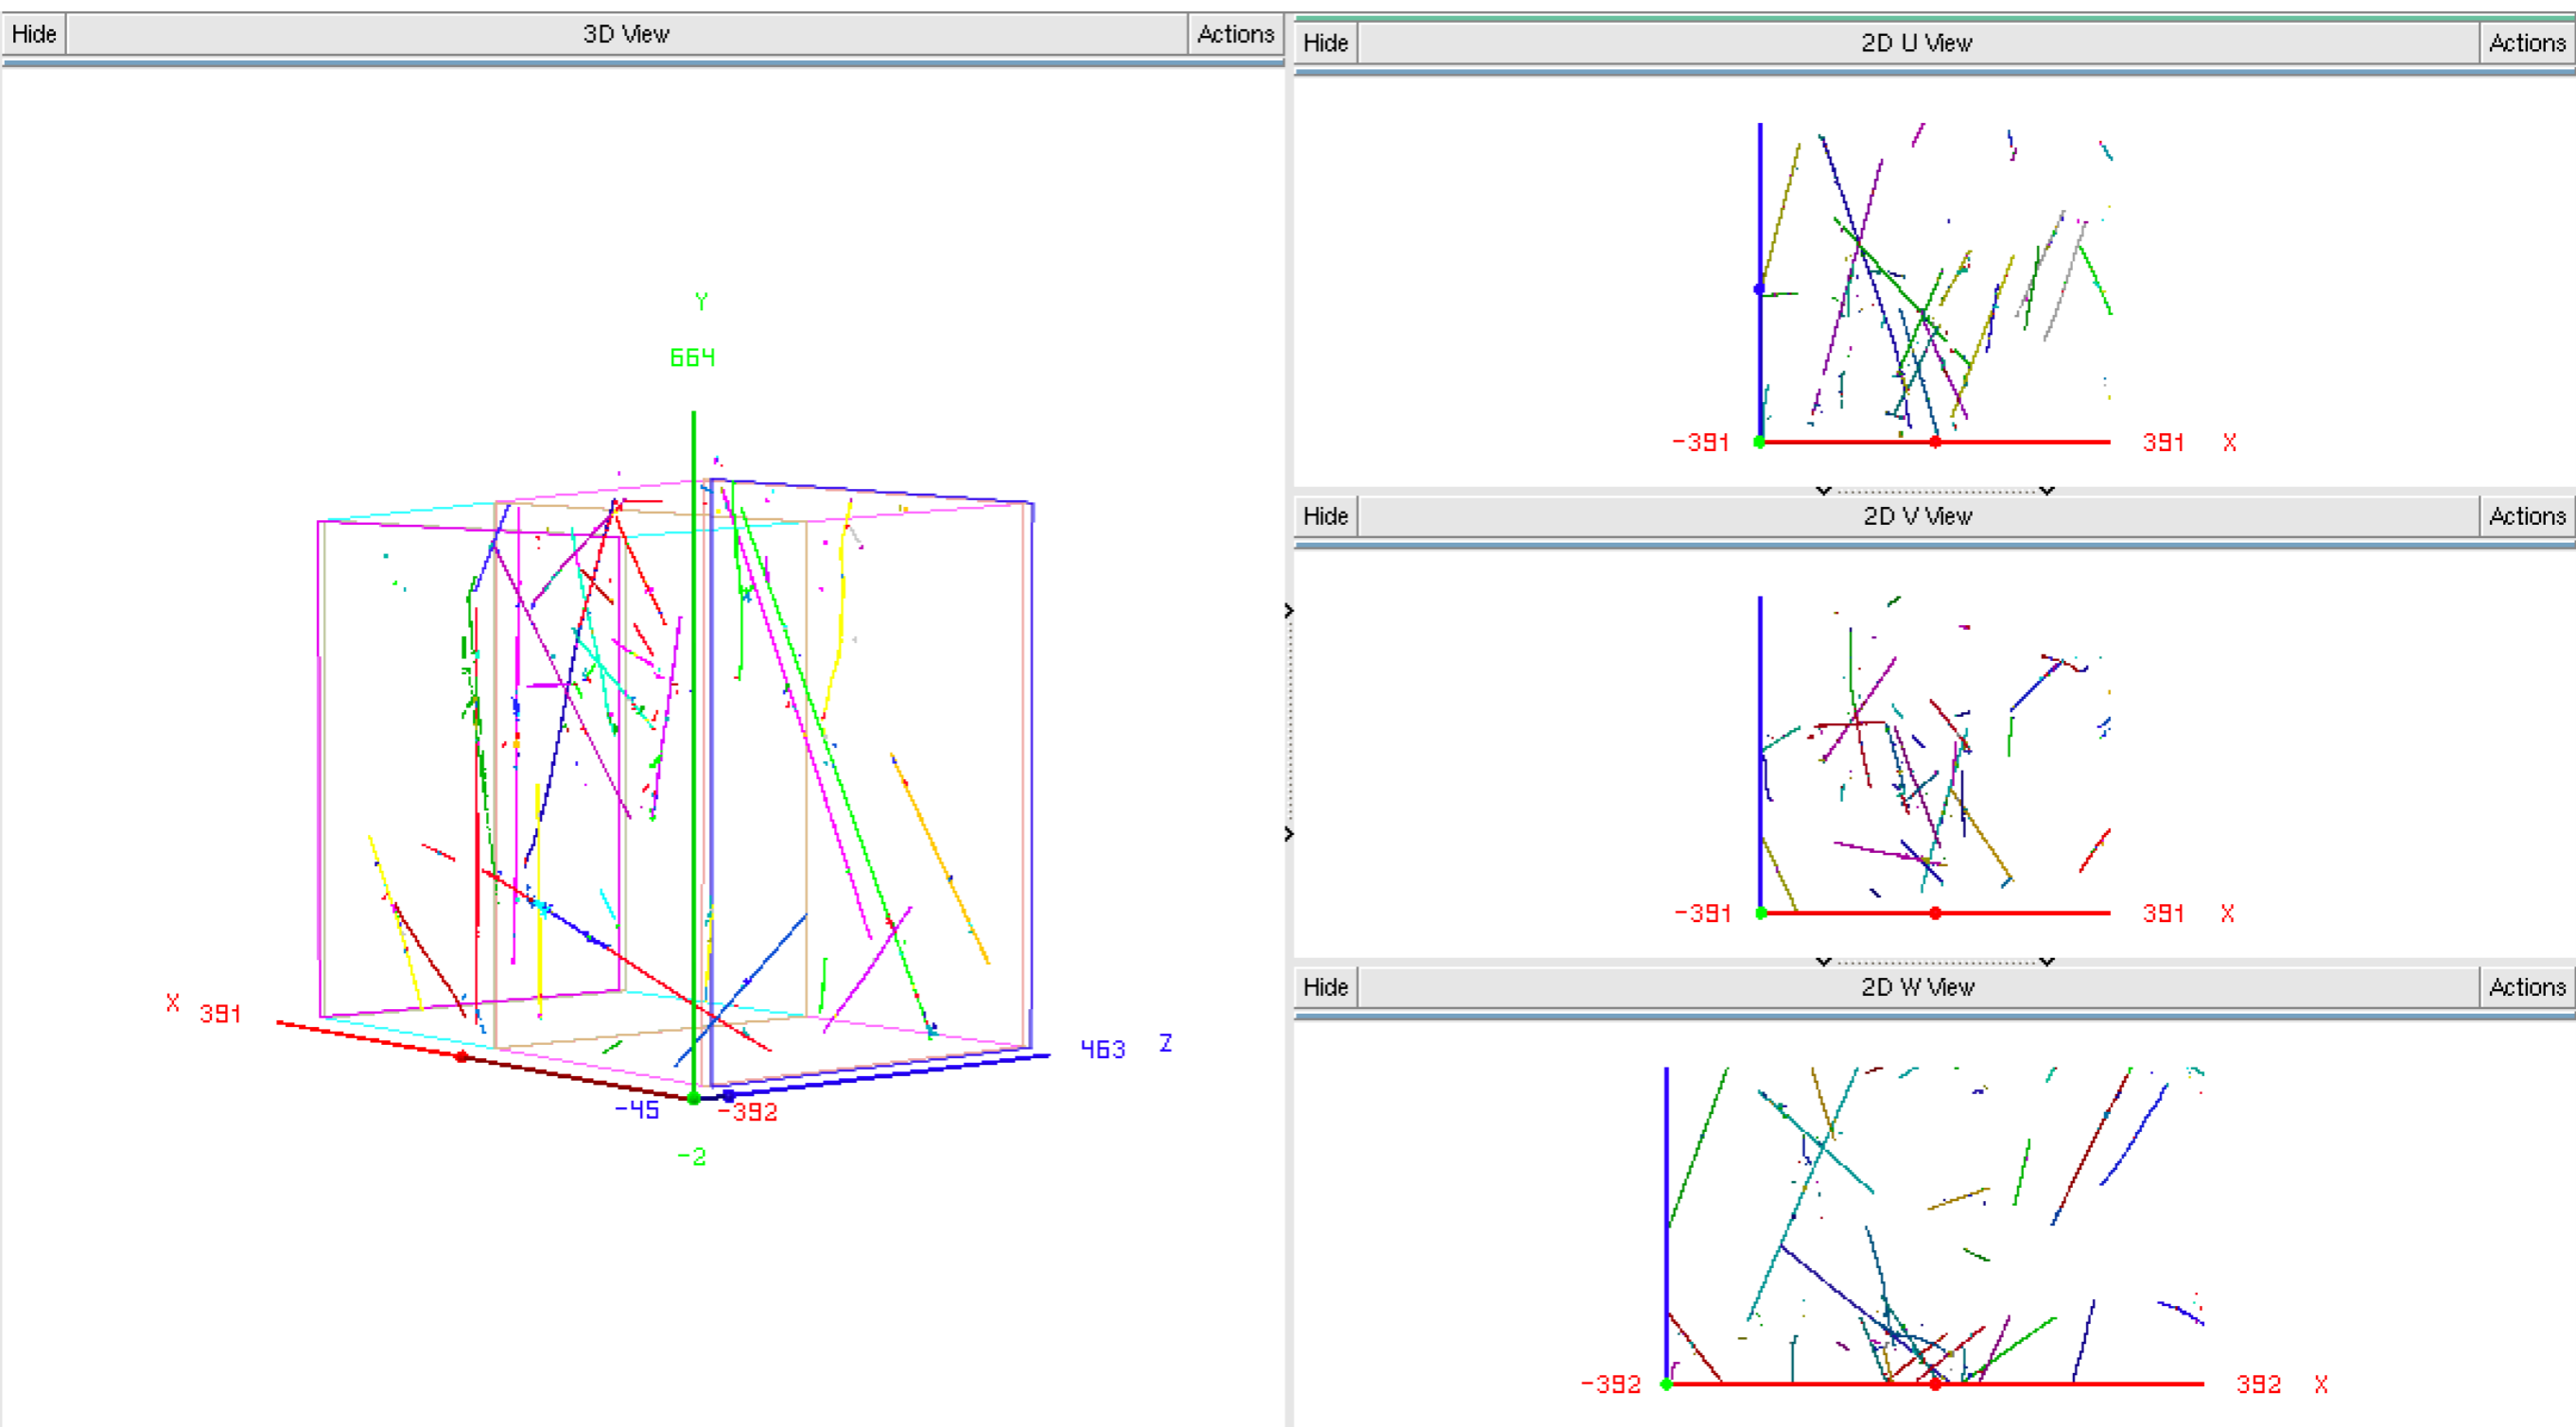

- Beam simulation interface
 - Minor change to adjust for a change of coordinate system
 - Otherwise appears to work out-of-the-box
- LArG4
 - Seems to work mostly out of the box
- Detsim
 - TPC simulation running with same configuration as ProtoDUNE-SP
 - Currently no optical system hits produced
- Pre-Pandora reco
 - Data preparation and WireCell running with ProtoDUNE-SP config

Pandora tests

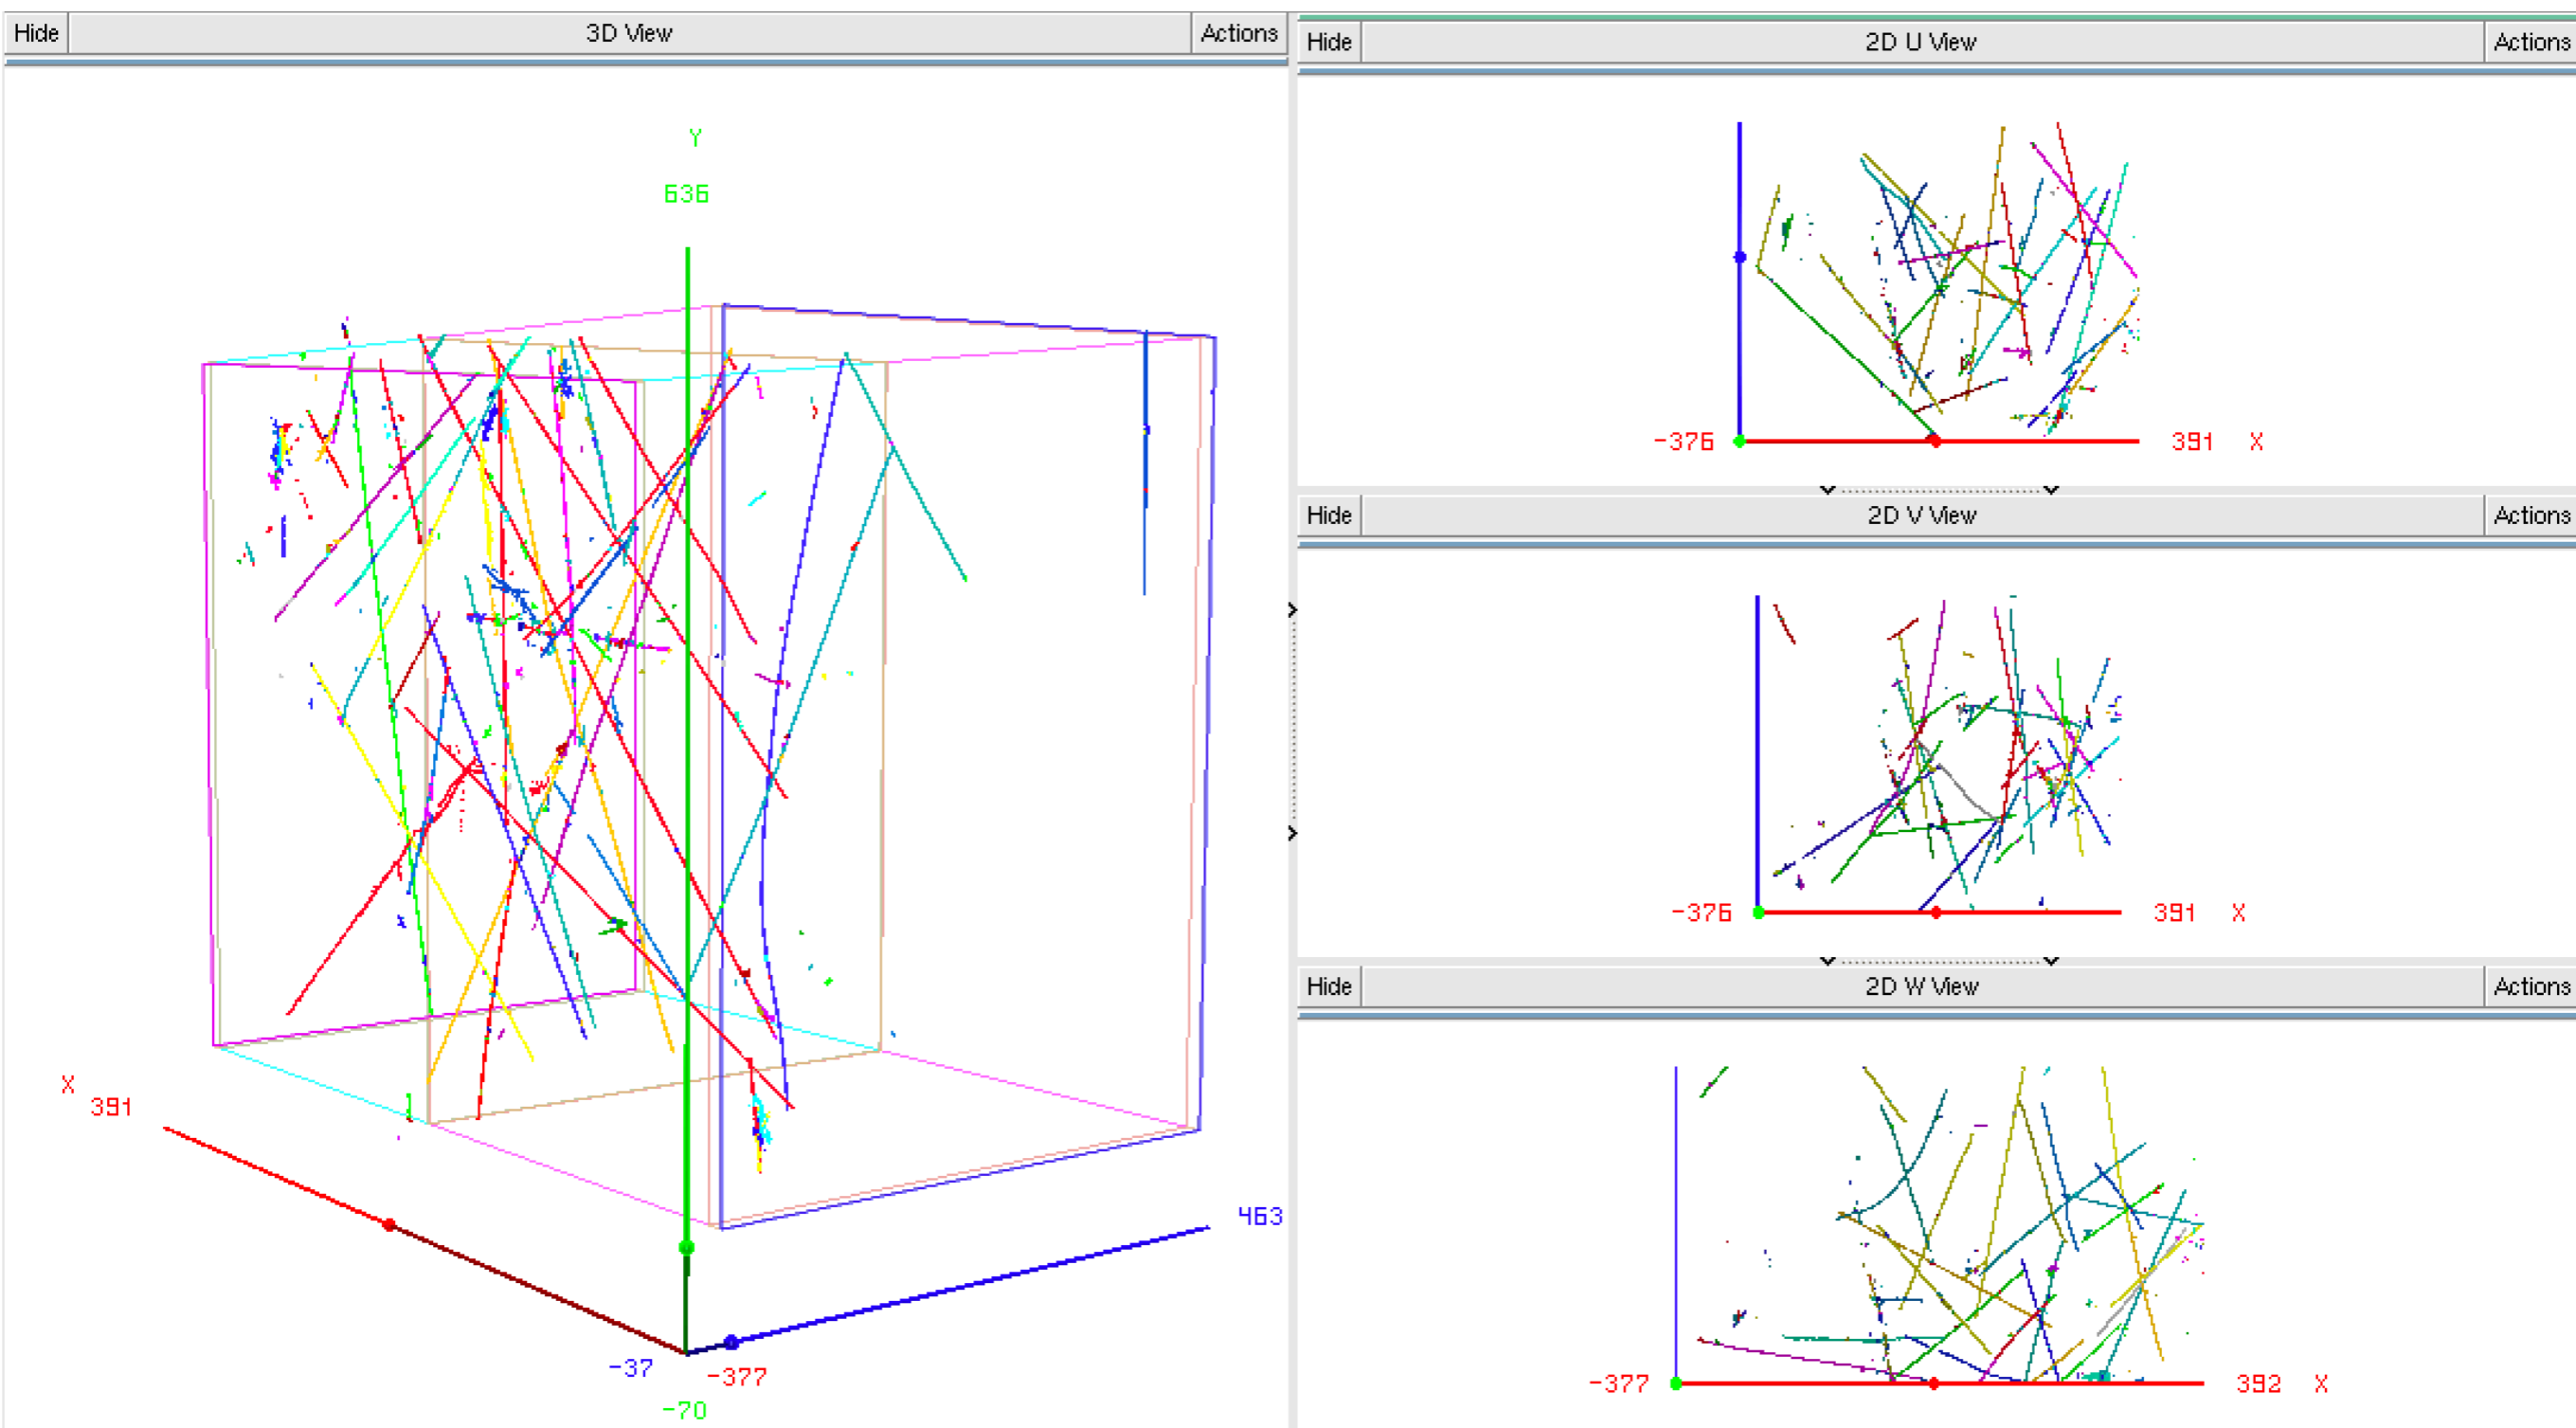

- I will show a few event displays here
 - They represent the simplest tests we could do for now
- Use the ProtoDUNE-SP configuration with no changes
 - New Pandora geometry for ProtoDUNE-HD exported from LArSoft
- It works!
 - Straight out of the box we see reconstructed particles
 - The first event showed a nice stitched cosmic ray

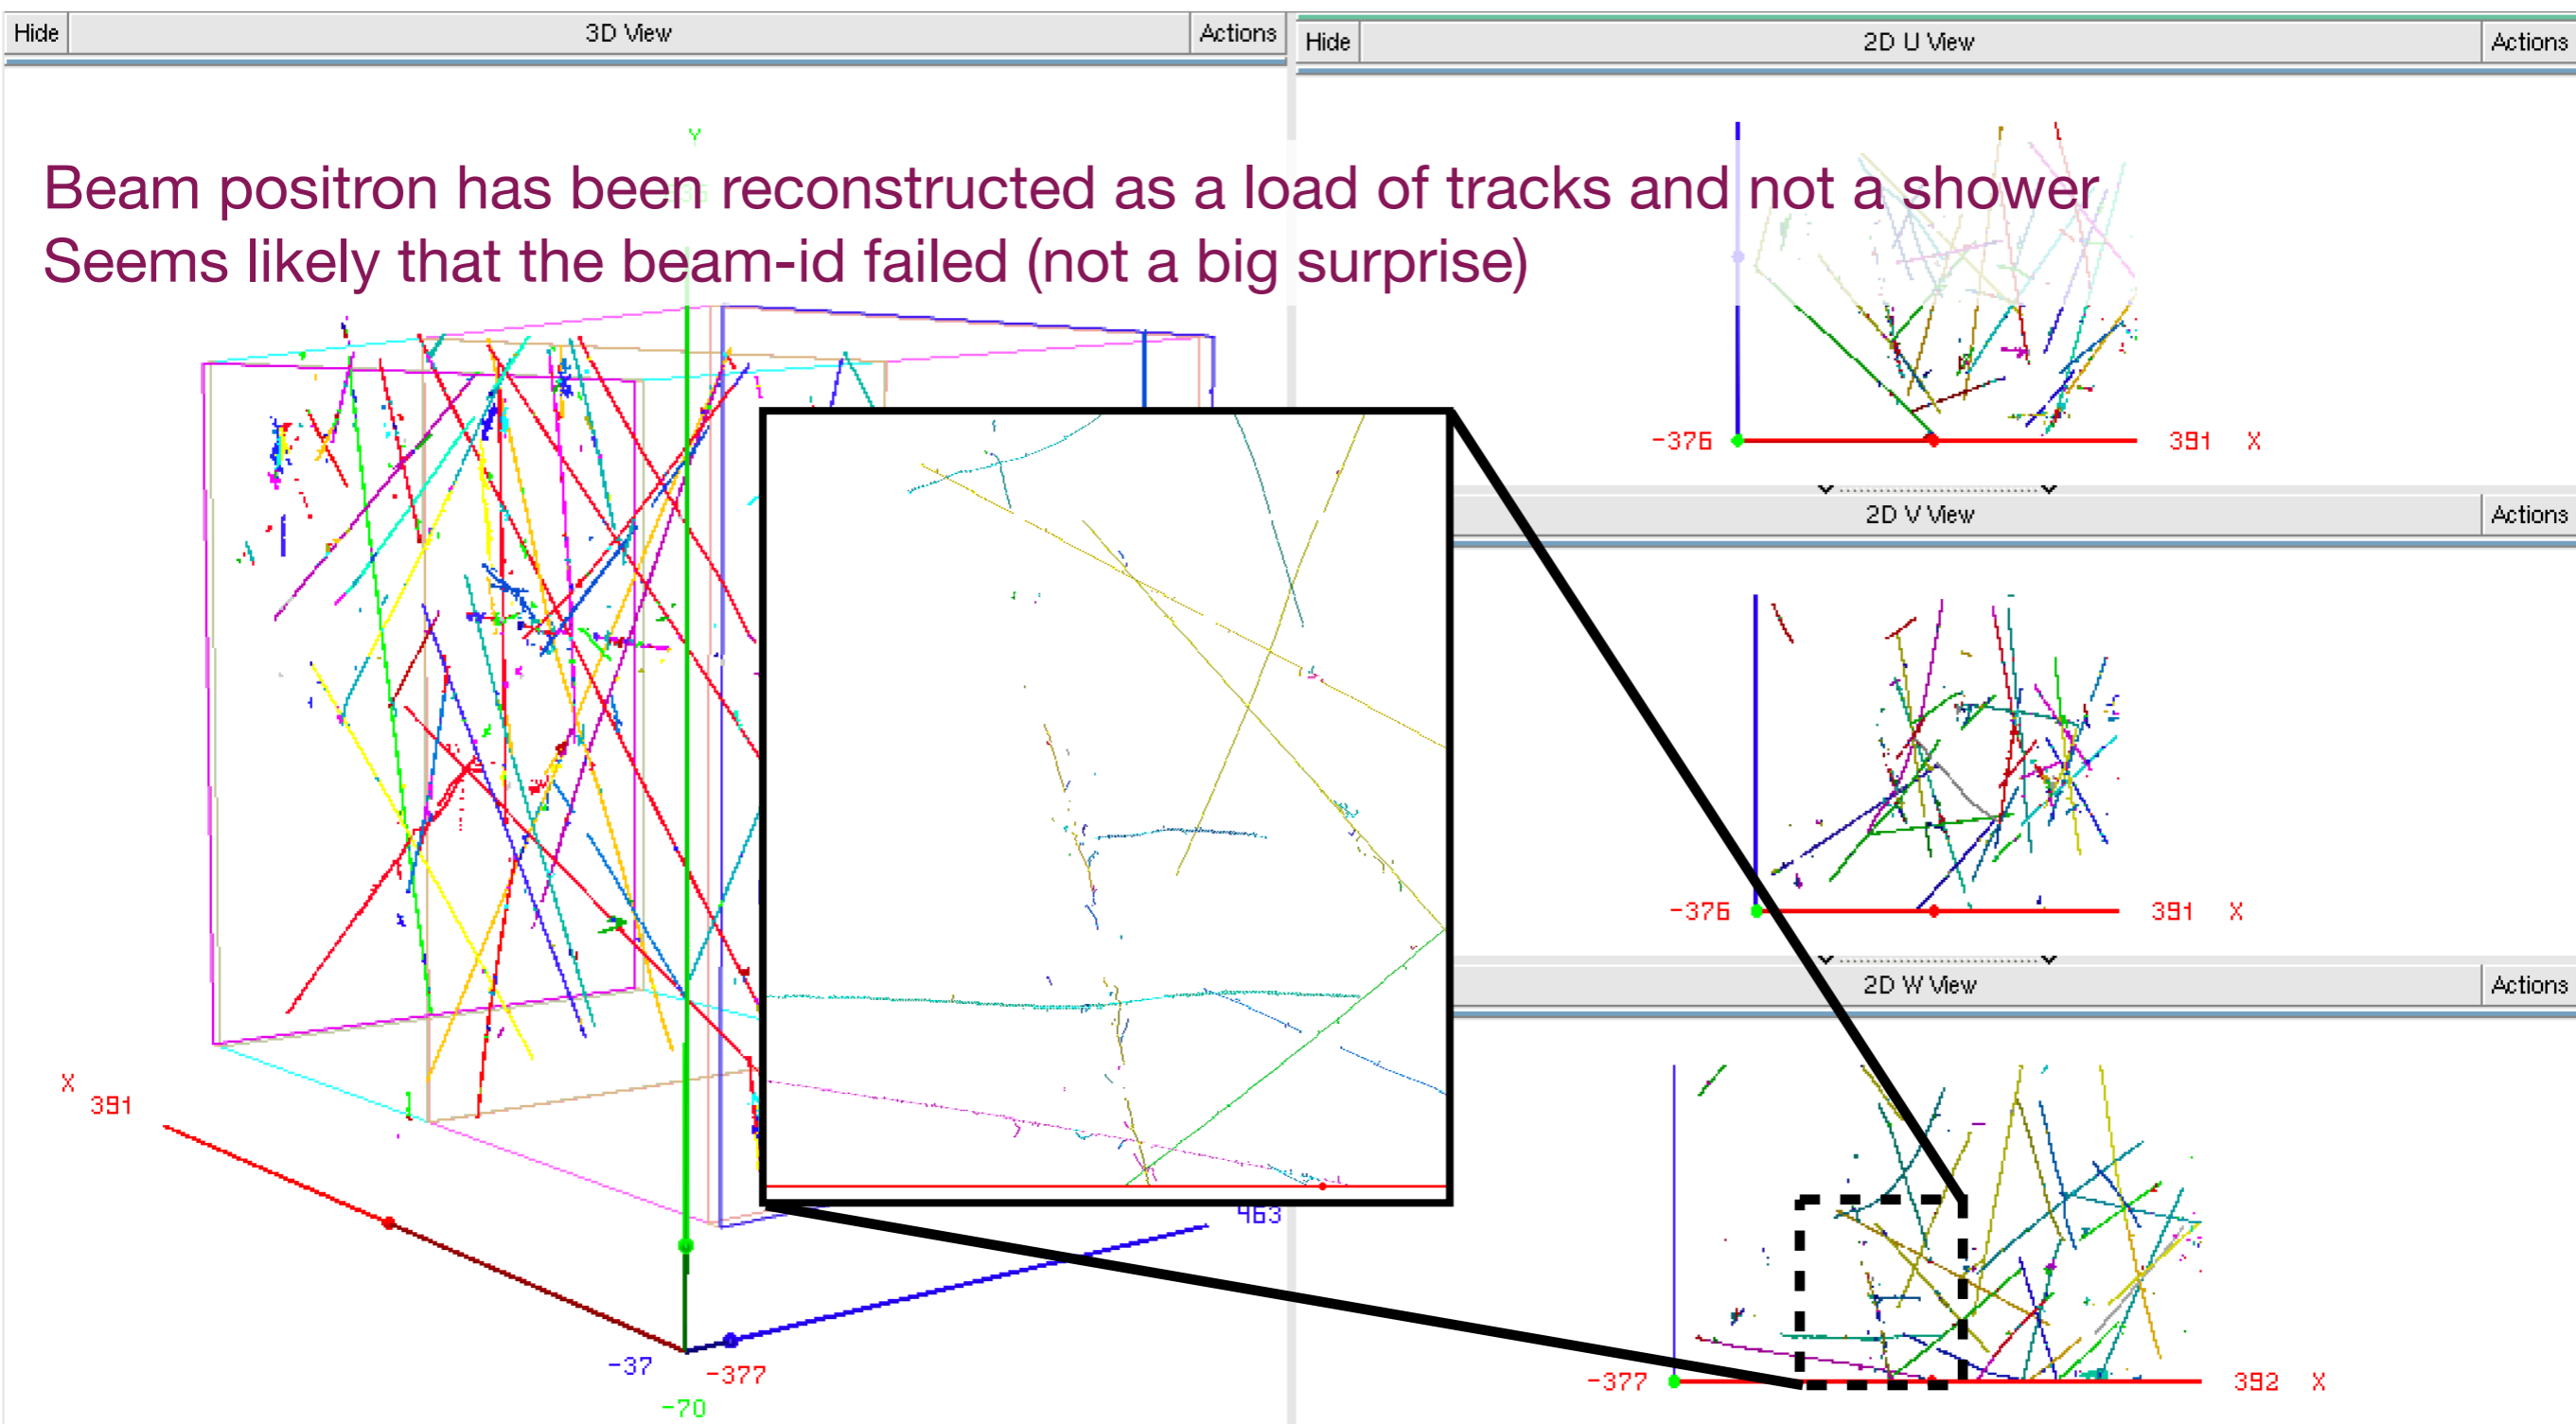

1 GeV/c pion + cosmic

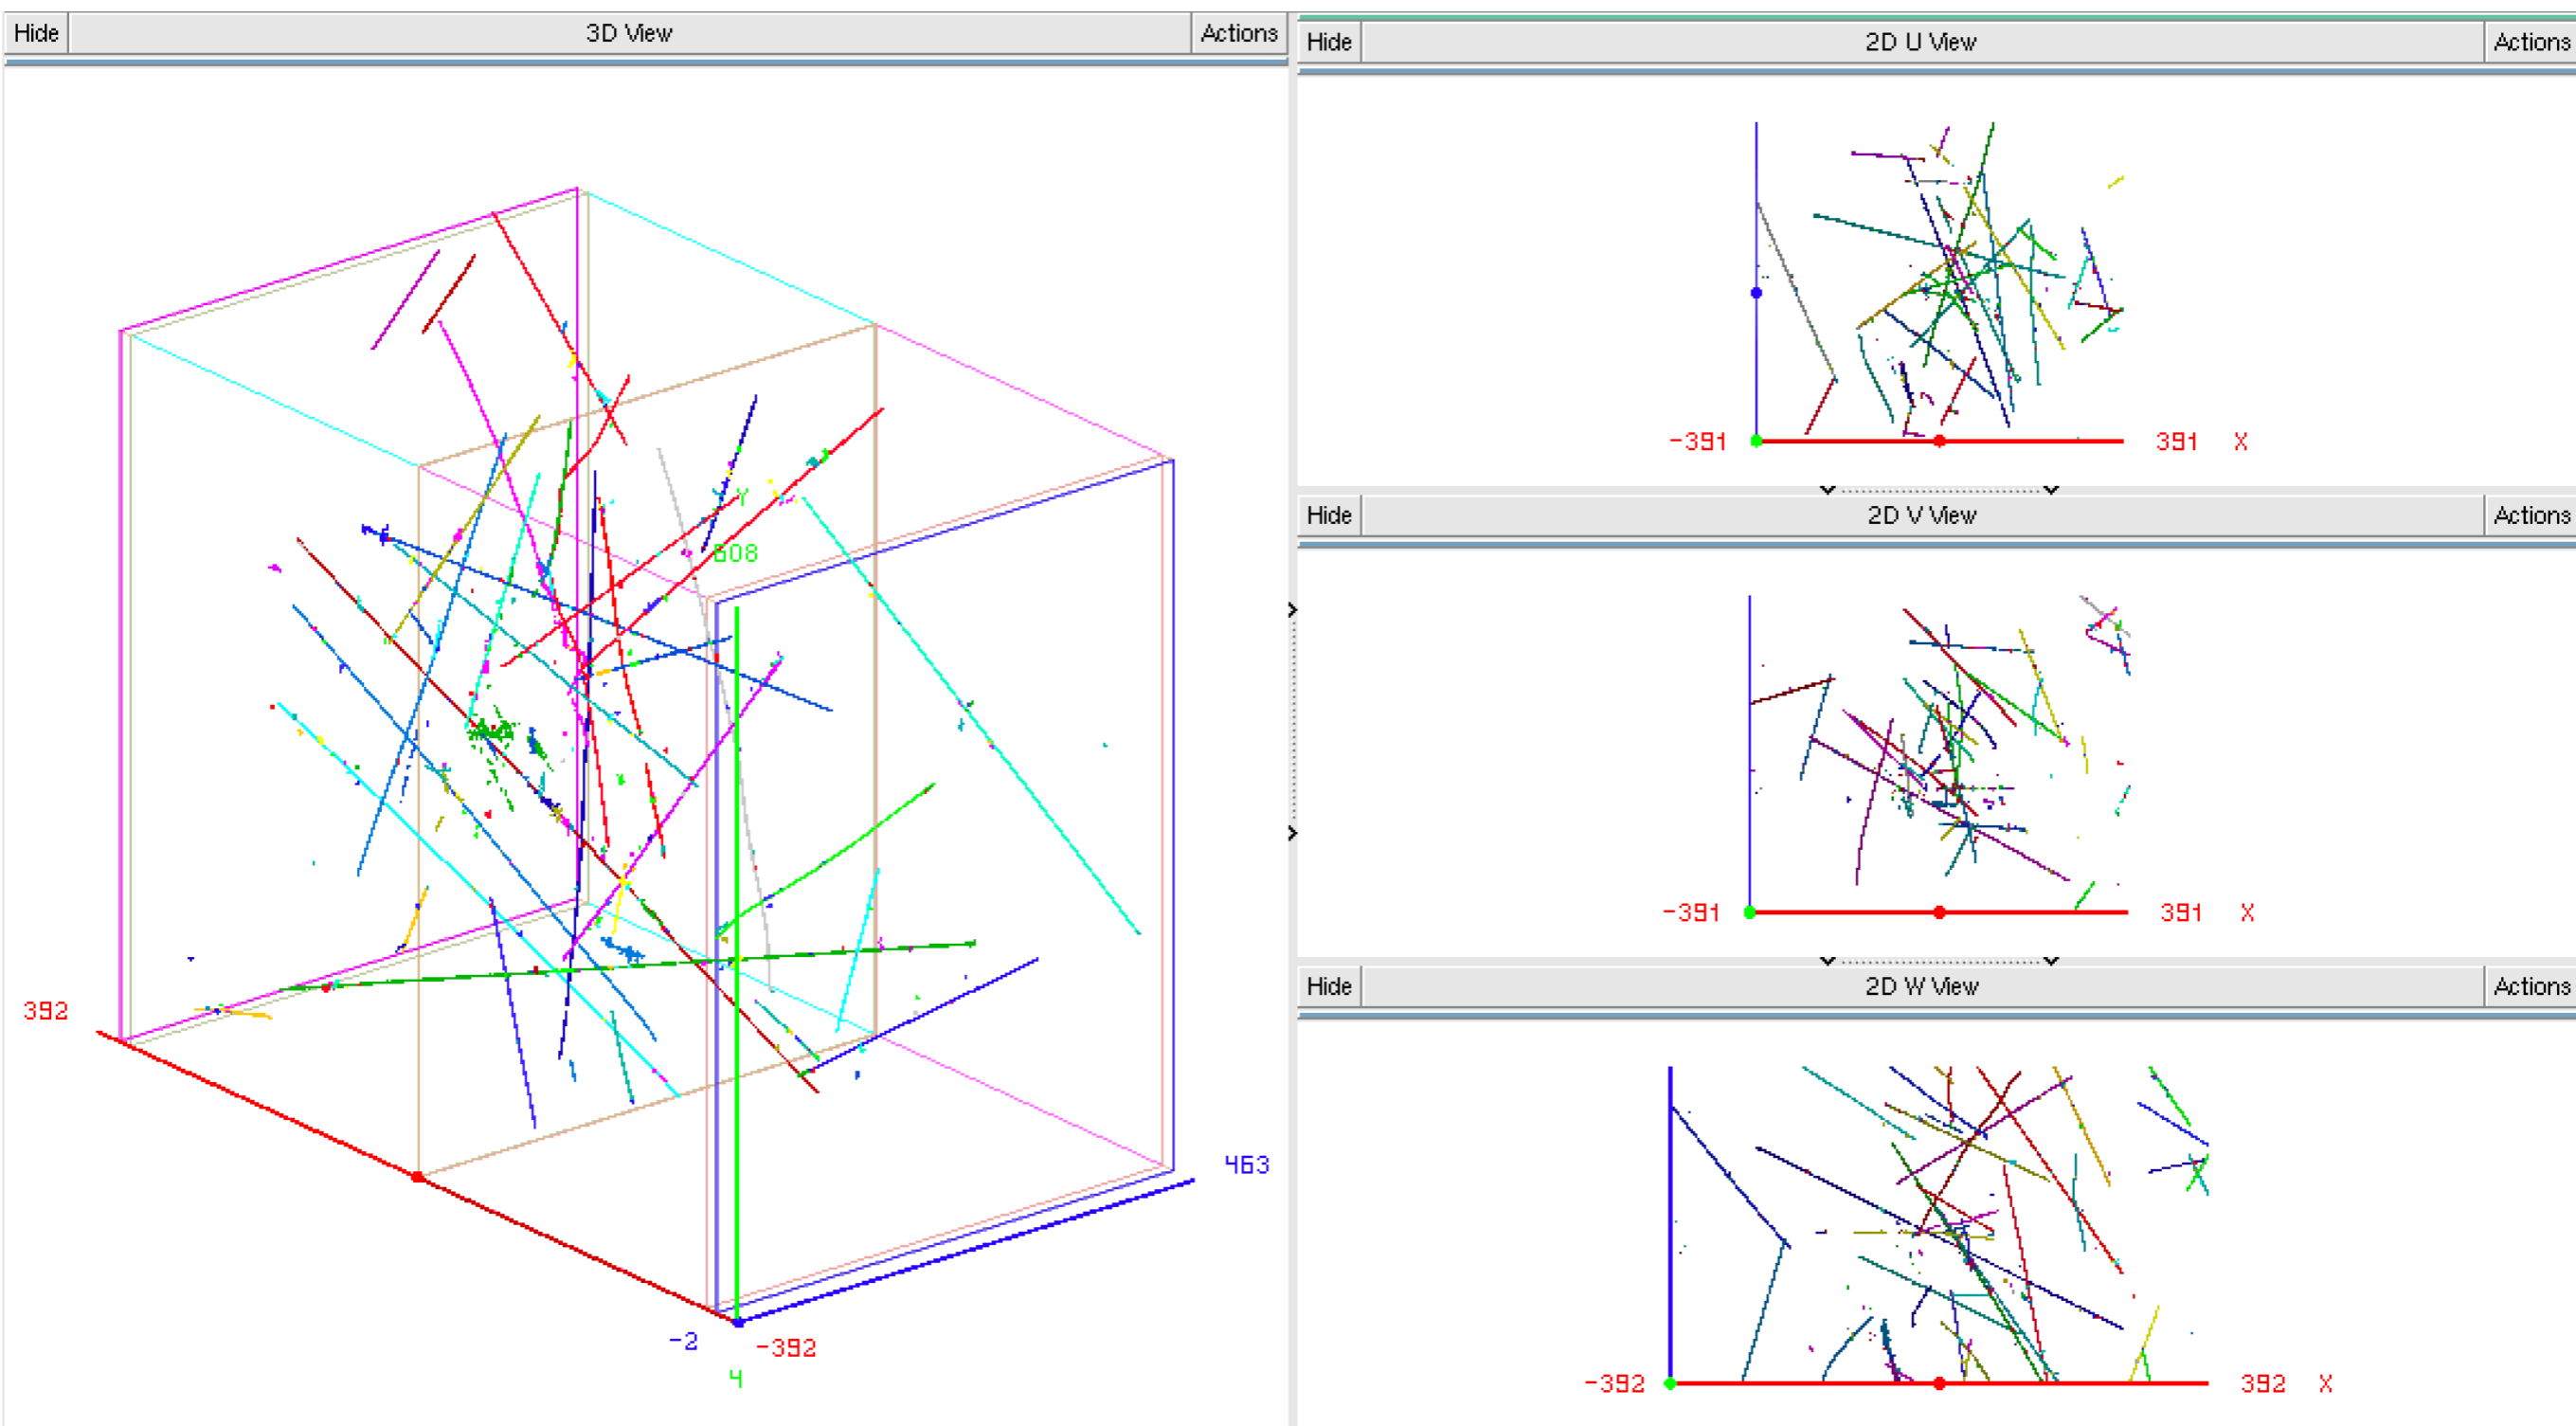

1 GeV/c positron + cosmics

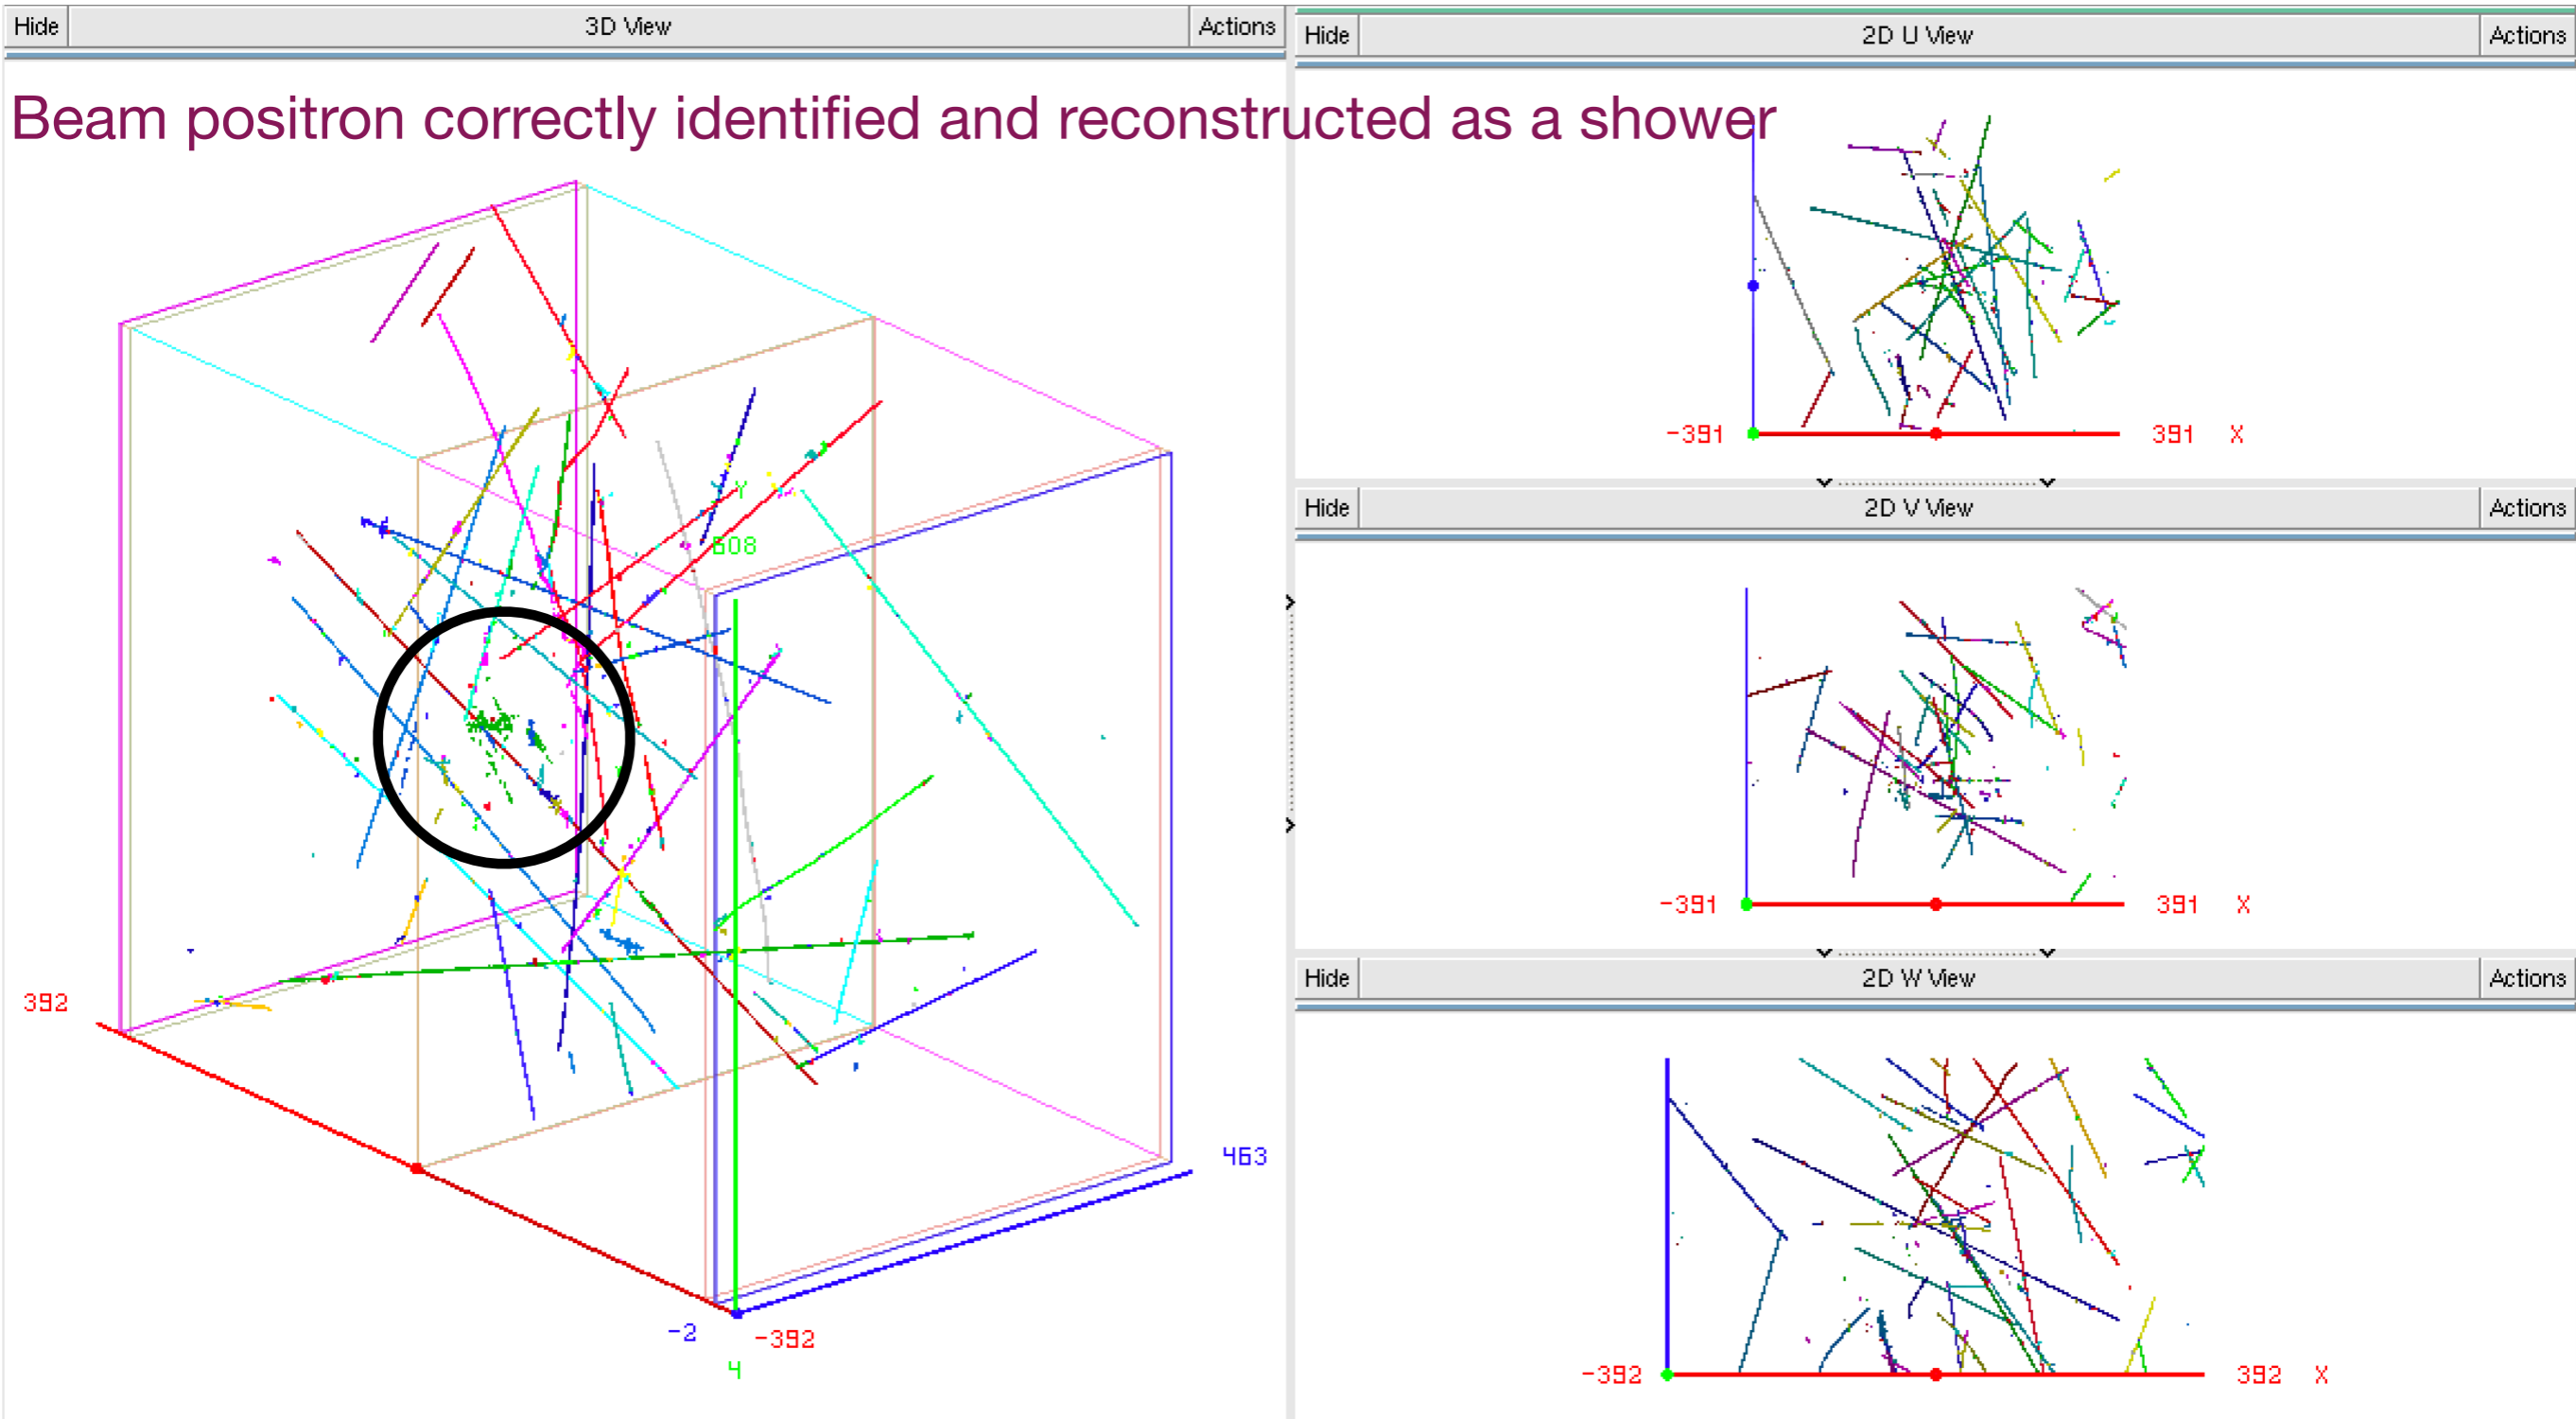

1 GeV/c positron + cosmics

1 GeV/c positron + cosmics

1 GeV/c positron + cosmics

Pandora for ProtoDUNE-HD

- I would like to include some of the new features in the default reconstruction for ProtoDUNE-HD
 - It's role should be to test the (new) FD algorithms
- Deep learning streaming
 - Small test on ProtoDUNE-SP simulation seemed promising
 - Important to be able to test the CNN on data!
- More use of calorimetry information
- Beam particle ID
 - Previous attempts to improve the BDT for ProtoDUNE-SP didn't really make much progress
 - New ideas? Perhaps this could actually be simplified?

ProtoDUNE-VD

- ProtoDUNE-VD will be housed in the ProtoDUNE-DP cryostat
- Design still seems to be evolving
 - But seems like there will be 2 CRPs
- There will be a 3rd convenor for the DRA group with expertise for ProtoDUNE-VD
 - To be announced (very) soon
- In terms of event reconstruction, I imagine we can use what has been developed for the vertical drift far detector

Summary

- ProtoDUNE-SP paper finally appeared on the arXiv!
 - Submitted to EPJC
- Work has started on ProtoDUNE-HD
 - Reconstruction looks to work OK from first event displays
 - Clearly need to study actual metrics soon
 - Decide the list of algorithms that will form the default reconstruction
 - Retune the different BDTs
- It will be a busy few months to ensure that we are ready for when ProtoDUNE-HD starts up
- We can expect ProtoDUNE-VD on a longer time scale than HD
 - Perhaps the middle of next year?
