

## July 2022 testbeam setup

*Straw TB team*

July 27, 2022

## April-June TestBeam

### Setup during April-June TestBeam

- Readout 1:
  - ▶ Straw with VMM3-based Mu2E
  - ▶ DAQ: VERSO
- Readout 2:
  - ▶ MicroMegas with APV
  - ▶ DAQ: MMDAQ3
- Cross-board: MM Layer 2 passed to both, Mu2E and APV readout.

## Setup

- Straw, horizontal, axis
- 3 MicroMegas, horizontal axis (only central region)
- 1 MicroMegas, vertical axis
- Cross-board: 56 channels from MM, 8 channels for straws and scintillators

Micromegas, horizontal axis

Micromegas, vertical axis

Micromegas, horizontal axis

Micromegas, horizontal axis

double read-out

Straw, horizontal axis

↑ Beam

## Goals

- “Cleaner” data  
(due to reduced distance between straw and MM)
- Take additional data with synchronization on Mu2E & APV  
(~ 800 GB)
- Test applicability of **Tiger ASIC**

### July setup

### April-June setup

## Tiger status

- Received Tiger chips
- Received Tiger-to-MicroMegas cross-board
- Produced double readout cross-board
- Installation of Tiger readout system in progress

Thank you for attention!

Backup slides

# Reminder: synchronization method

12bit BCID counter >> 4096 BCID x 25ns >> ~102us full circle

## Synchronization method

- Using two-channel pulser generator
- Sending two signals with different frequencies and constant ratio between them.
- For Mu2E:
  - ▶ Fine timing based on 12-bit BCID count (each BCID – 25 ns, full cycle – 102  $\mu$ s)
  - ▶ Pulser frequency selected to have two pulser signal in one cycle – 20 kHz
  - ▶ Estimated pulser period in 25ns counter: 2000 counts
- For APV:
  - ▶ We have trigger veto  $\sim 1.2$  ms ( $\sim 1.0$  ms) for April-June (July) TB
  - ▶ Pulser frequency selected to be 200 times lower then for Mu2e – 100 Hz
  - ▶ Estimated pulser period in 25ns counter: 400000 counts

## Signal scheme description

- Mu2E:
  - ▶ Triple scintillator coincidence passed to channel 60
  - ▶ 20 kHz pulser signal passed to channel 63
- APV:
  - ▶ OR of the:
    - ★ Triple scintillator coincidence
    - ★ 100 Hz pulser signal
  - passed as a APV trigger with veto  
~ 1.2 ms (~ 1.0 ms) for April-June (July) TB
  - ▶ 100 Hz pulser signal passed to the APV #2 (used only for pulser signal)
