## Antistatic-antistatic-light-light potentials from lattice QCD

*Thursday, 3 August 2023 16:20 (20 minutes)*

We present results for the potential of two static anti-quarks in the presence of two light quarks. We improve on existing results the  $\bar{b}b\bar{u}d$  tetraquark system by computing the static potential at off-axis separations, significantly increasing the number of data points in the crucial region of small distances. Moreover, we show entirely new results for the static potential of a  $\bar{b}b\bar{u}s$  tetraquark. Finally, we discuss phenomenologically motivated parametrizations of the potentials.

### Topical area

Hadronic and Nuclear Spectrum and Interactions
