From the Affine Ising model to Quantum Geometry in curved space

Tuesday, 1 August 2023 13:50 (20 minutes)

A general geometrical framework is explored for quantum field theory on curved manifolds motivated by the recent map of the 2d Ising model on a triangulated grid to reproduce the integrable conformal field theory (CFT) on the modular torus (\mathbb{T}^2) and the Riemann sphere (\mathbb{S}^2). This talk will emphasize the special role of affine transformations as a bridge between Regge's simplicial Einstein gravity and simplicial lattice field theory at or near to an infrared critical point. To test and refine this geometrical framework a gradual sequence of lattice fields theories is being considered, including fermionic and gauge fields on cylindrical ($\mathbb{R} \times \mathbb{S}^{d-1}$) manifolds.

Topical area

Theoretical Developments

Primary author: BROWER, Richard C. (Boston University)

Co-authors: AYYAR, Venkitesh (Boston University); Dr COGBURN, Cameron; FLEMING, George (Fermilab); GLÜCK, Anna-Maria Elisabeth (Heidelberg University); MATSUMOTO, Nobuyuki (RIKEN BNL); OWEN, Evan (Boston University); RABEN, Timothy (University of Kansas); Prof. TAN, Chung-I (Brown University)

Presenter: BROWER, Richard C. (Boston University)

Session Classification: Theoretical Developments
