

Synoptic Displays for HBESL and NML Laser Lab

By Didier Muvandimwe
Hendrix College, Conway, Arkansas
SIST program, 2012
Supervisor: Jinhao Ruan

Outline

- What is synoptic?
 - Description and components
- How does it work?
 - Needs and execution of displays
- HBESL and NML Laser lab synoptic displays
 - Building and maintaining

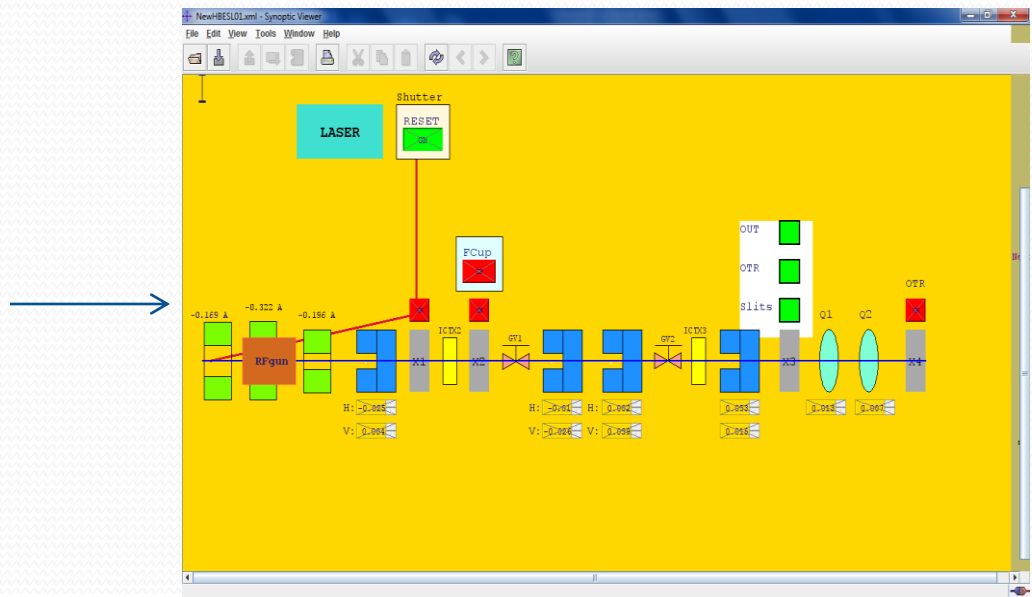

What is synoptic?

- GUI builder and runtime environment
 - System for graphical representation of real-time data in the control system of Fermilab .
 - ❖ Availability of the real-time data at any time everywhere
 - ***How?***
 - ✓ Creates diagrams representing a certain machine or process.
 - ✓ Providing actual reading from the control system indicating its current state.
 - ✓ Setting data back to the control system

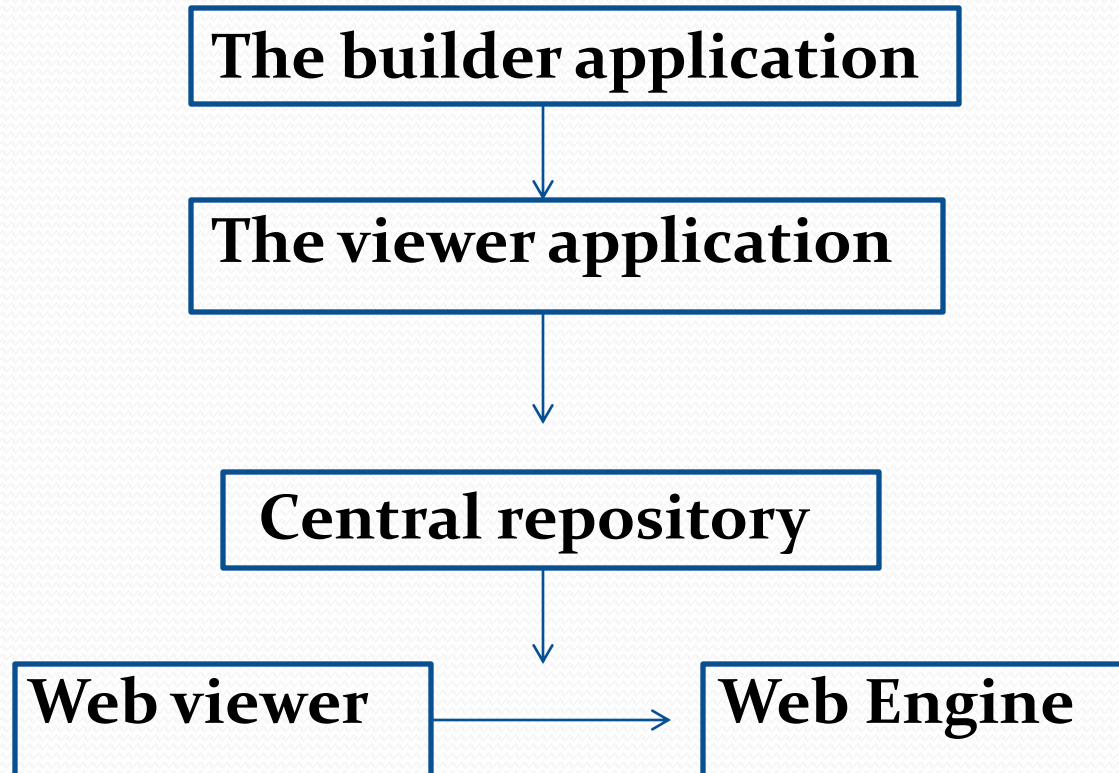

HBESL Beam line

Synoptic display

5 Components of the system(Synoptic)

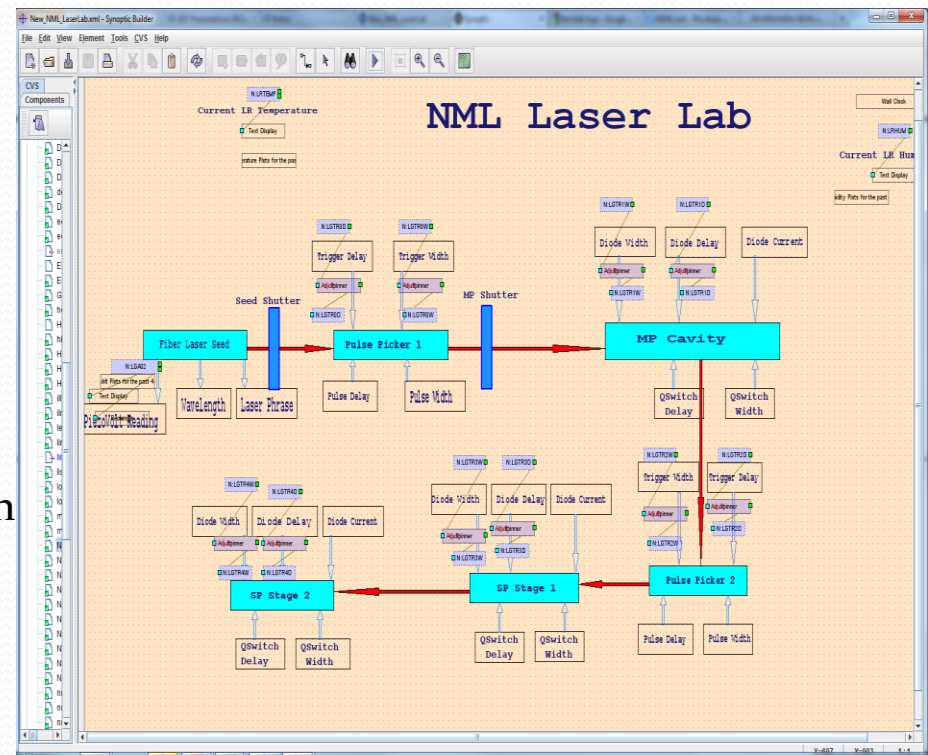

Running Options: *Builder/Viewer Application, and web viewer*

How? What do you need?

Builder application

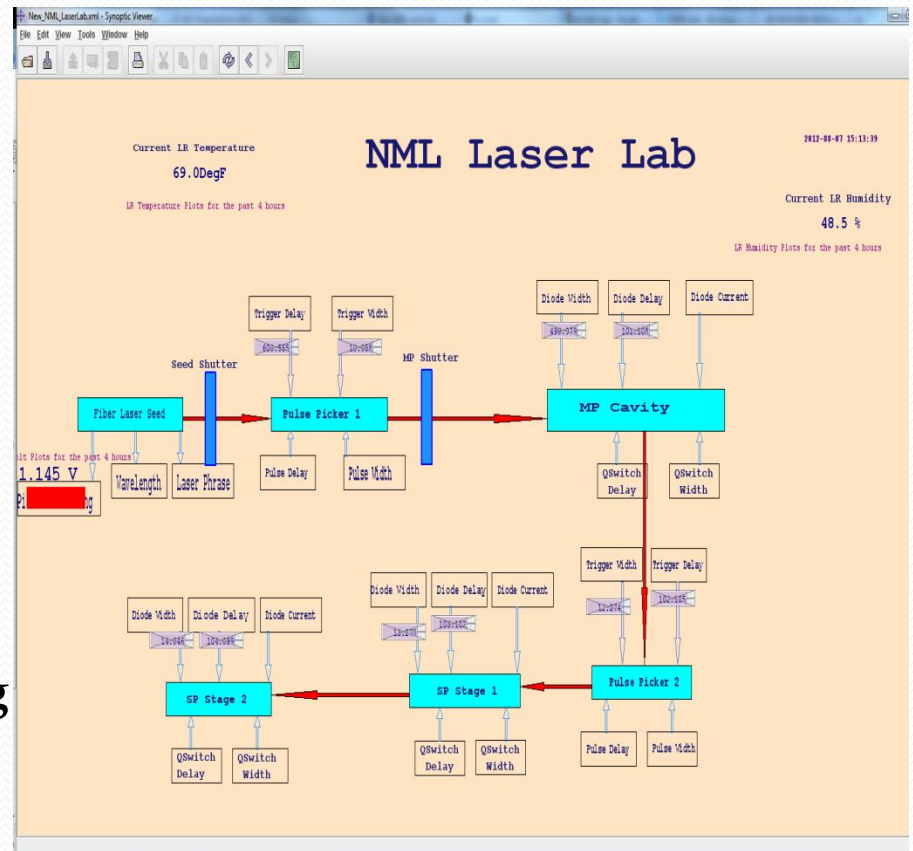

❖ **The builder application:**
program used to build/edit displays

- **Locally**
 - <http://synoptic.fnal.gov>
 - Launch builder
- **Requirements**
 - Java Runtime Environment (JRE)...Java SE 6
 - Saving displays in the central repository
 - Fermilab Network connection
 - Running: MIT Kerberos account
 - Synoptic password

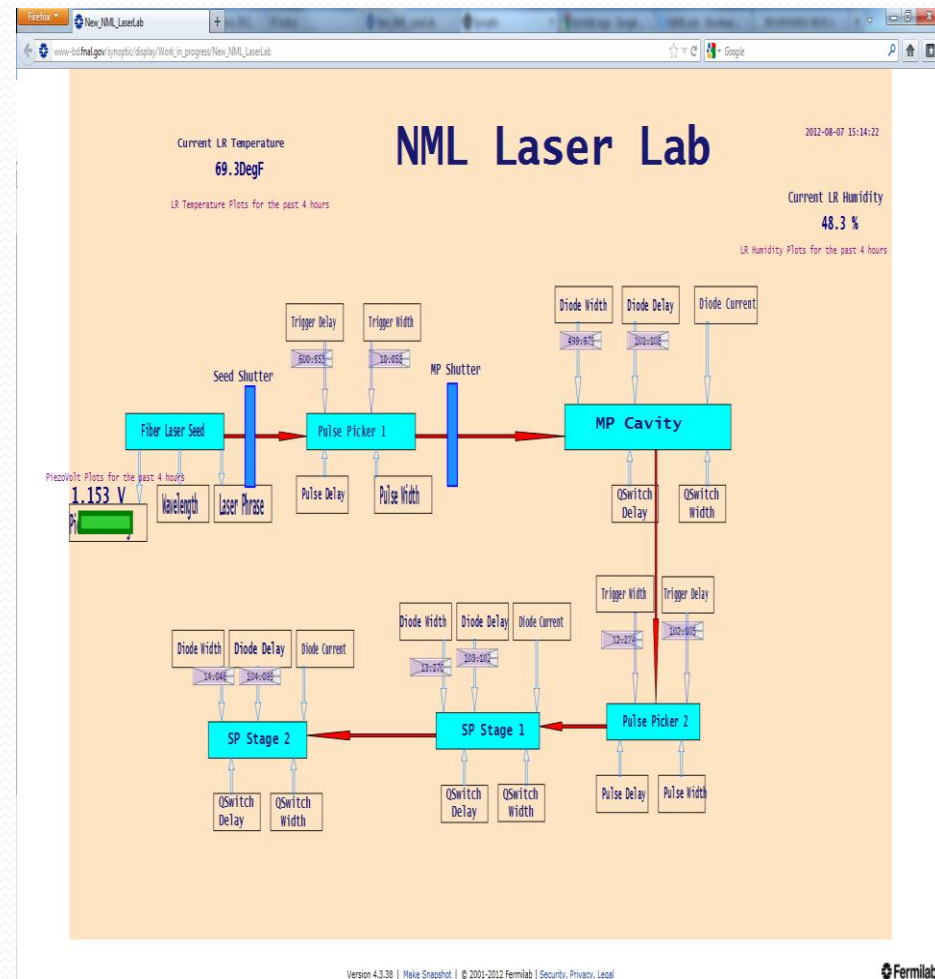

The viewer application

- ❖ program(Java application) to execute synoptic displays
 - **Opening**
 - **Locally:**
 - <http://synoptic.fnal.gov>
 - Launch viewer
 - **Requirements**
 - Java Runtime Environment (JRE)...Java SE 6
 - Reading data
 - Fermilab Network connection
 - MIT Kerberos ticket
 - **Data connection and Setting control**
 - Synoptic password

Running web viewer

- Can be opened on different web browsers (Firefox, Chrome, Safari)
 - Internet explorer (SVG plugin)
- No strict security policies: No user authentication needed, can even be opened outside of the Fermilab network.
- Impossible to set data to the control system

How were the displays created

- Schematic provided
- Details on what devices needed to be read-out or/and controlled
- Building and editing displays from scratch using the builder application of synoptic

HBESL Schematic

❖ High Brightness Electron Source Laboratory

GV: Gate valve

Qn: Quadruples

Xx: Screens

H/V: Horizontal/Vertical stepping motor

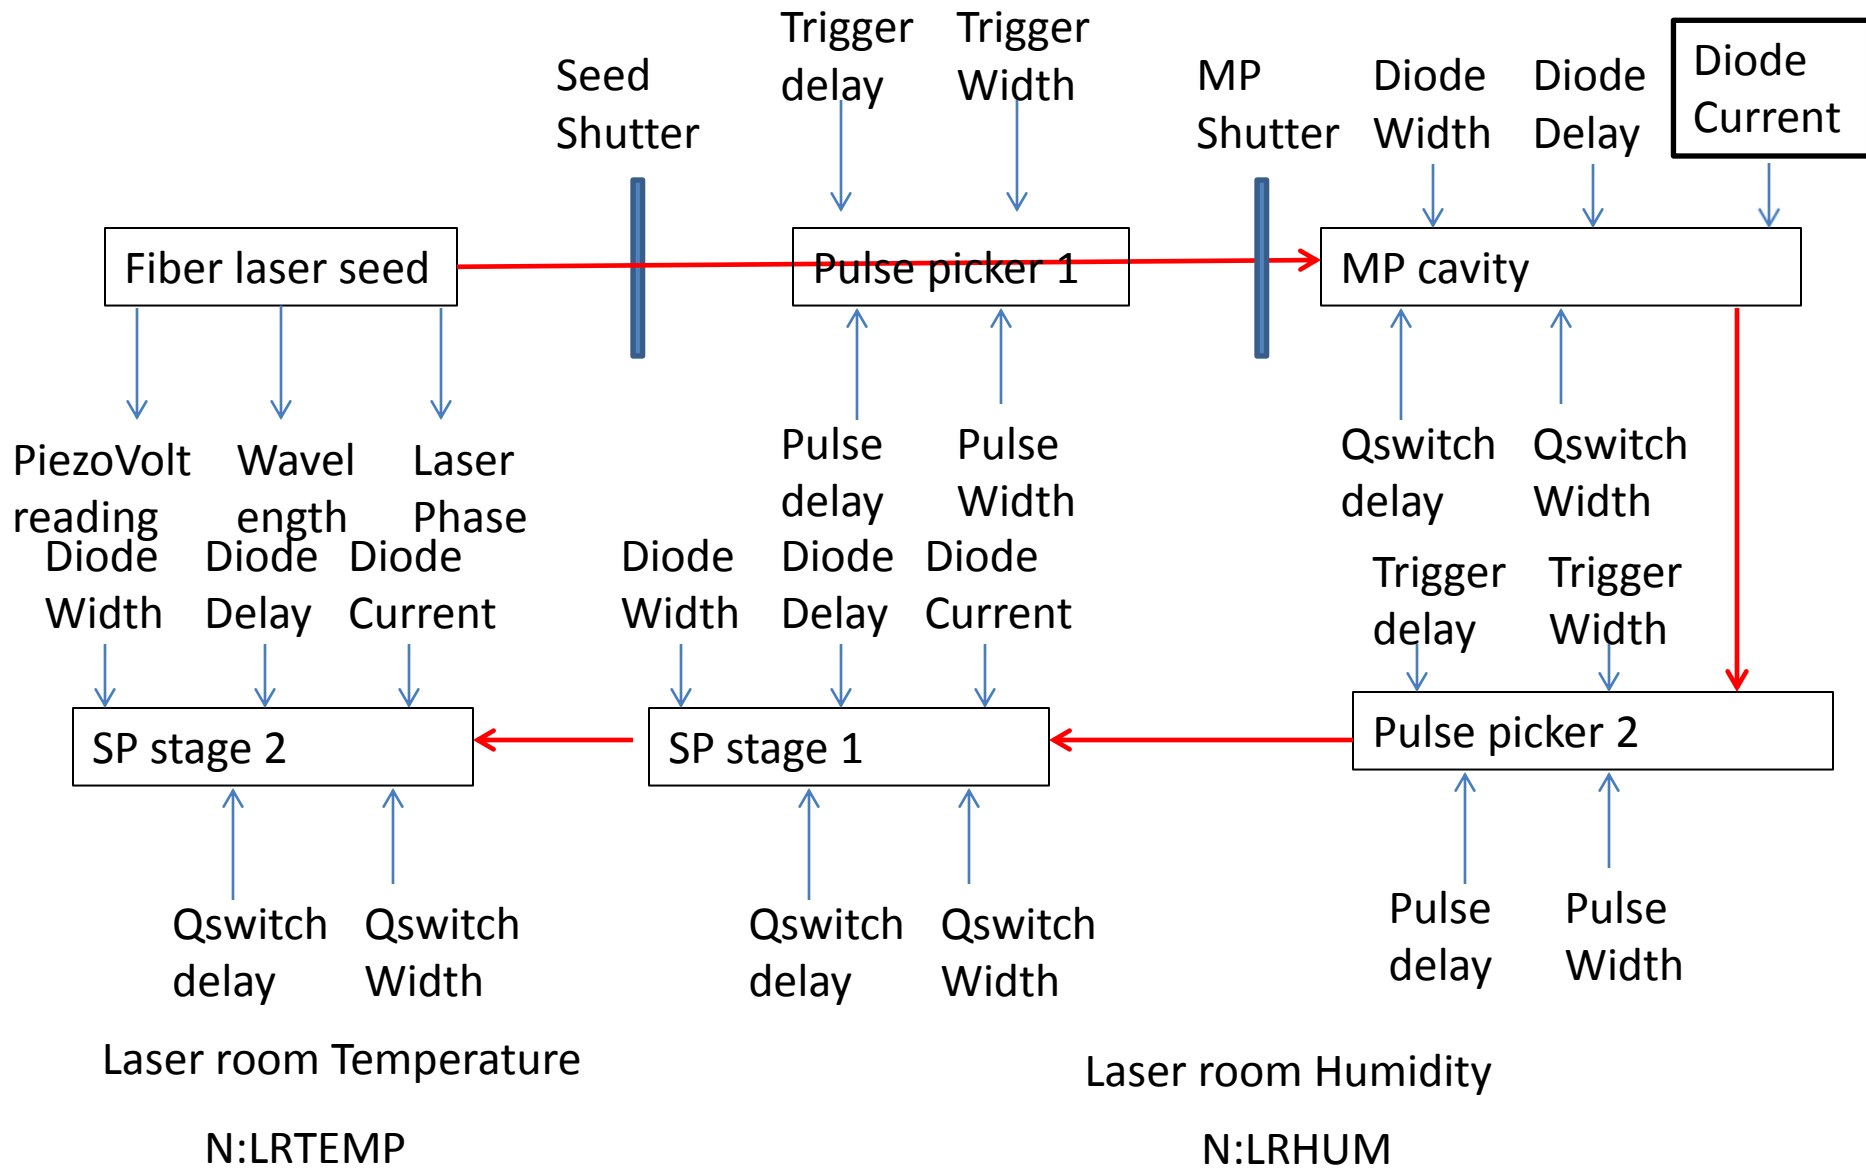

ICTn: Integrated Current Monitors

TDC: Transverse Deflecting Cavity

SOLn: Solenoid magnets

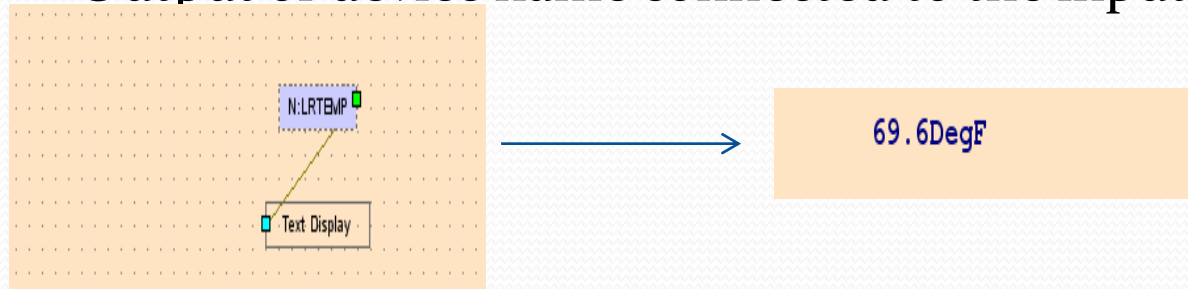

Gun: RF Gun

NML Laser Room Schematic

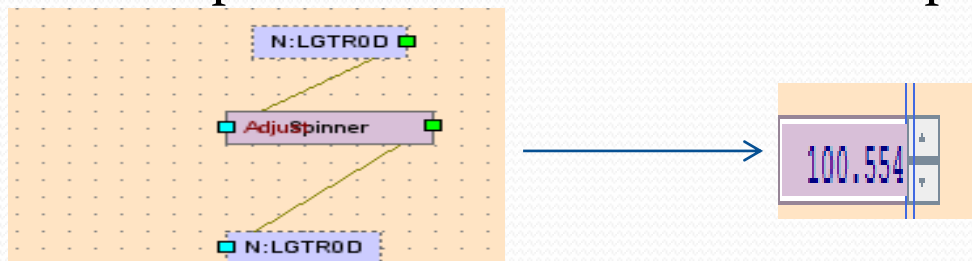

Reading and controlling devices

- The temperature reading in the laser experiment
 - Special name for each device & its connection to the ACNET
 - Importing the read-out values in synoptic
 - Read-out:
 - Output of device name connected to the input of “text display”

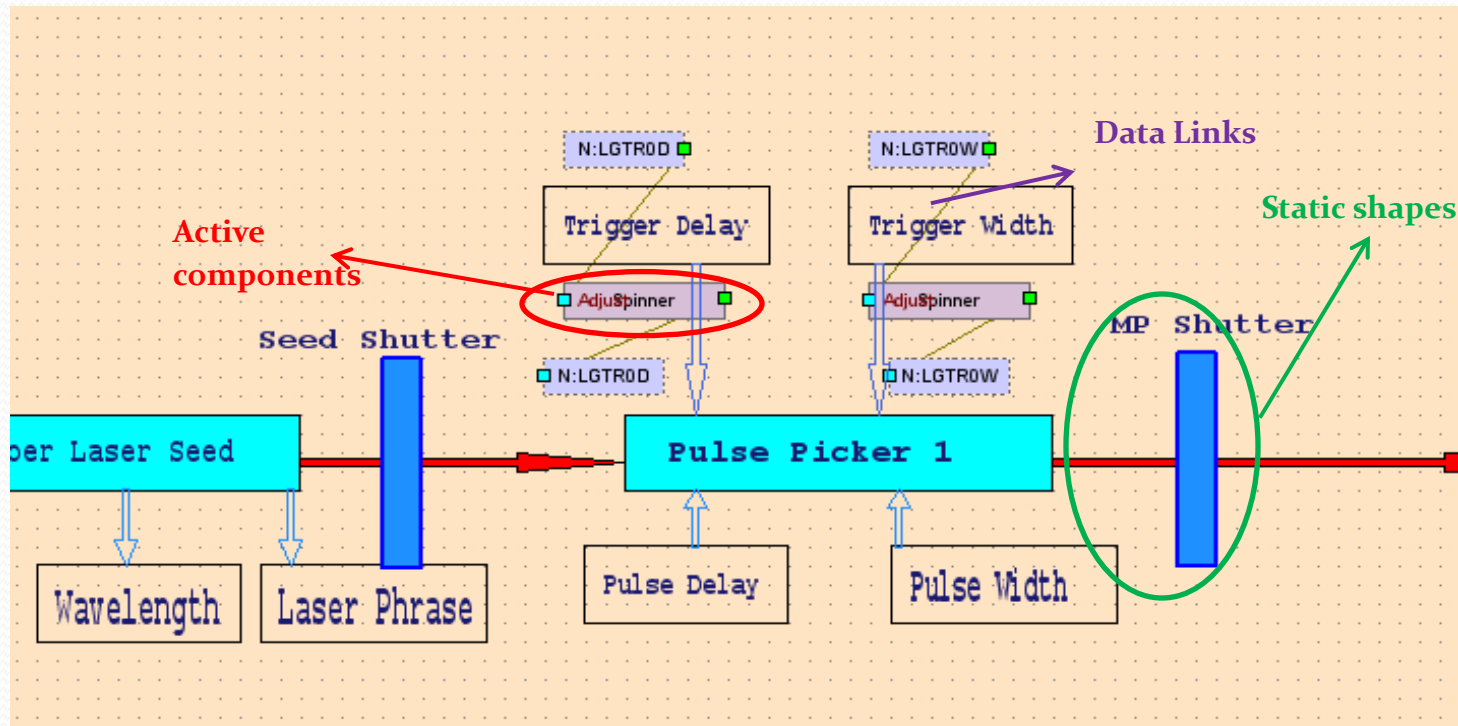

- Controlling: Reading-out and setting
 - Output of device name —————> input of spinner and
 - Output of device name —————> input of device name

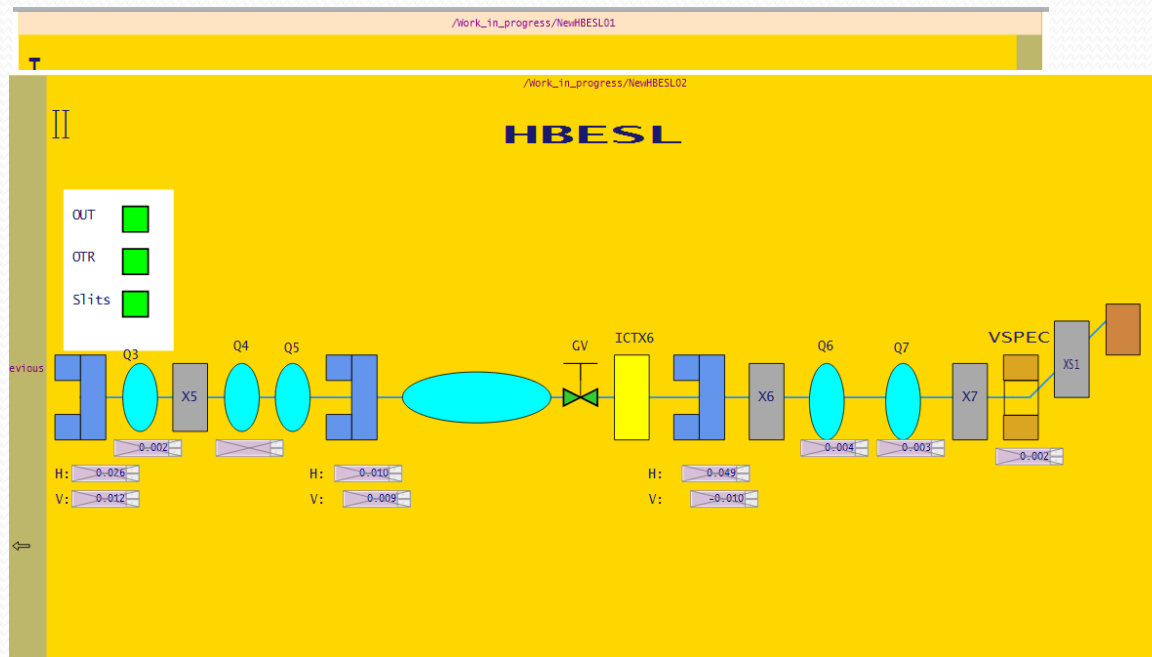

Classification of Components(Builder Application)

- *Active components*, *static shapes*, *data links*, and *displays*

- Work done on HBESL

- HBESL display built and saved in the central repository:
Can be easily accessed by many users
- Can be accessed from ACNET console
 - http://www-bd.fnal.gov/synoptic/display/Work_in_progress/NewHBESL02

Work done on the display

- Web viewer:
 - http://www-bd.fnal.gov/synoptic/display/Work_in_progress/New_NML_LaserLab
- The display was added on ACNET

Summary

➤ Work Completed

- Both displays(HBESL beam line & Laser experiment) were produced, added on the ACNET page under NML sub-page.

Future work

- Due to some technical reasons, some addresses are not set up yet...still need to be added on the display once they are available.

Acknowledgments

- Dianne Engram, Jamieson Olsen, and the entire SIST committee.
- My supervisor : Jinhao Ruan, and his assistant: Jamie Santucci.
- My mentors: Elmie Peoples, and David Peterson
- Dr. James Davenport
