## DUNE TMS MAGNET

- ‘Short Stack' Design
- Magnetic Flux Density Comparison

## J. White, Guosheng Ye

Argonne National Laboratory 29 March 2023

## SUMMARY

- Current magnet design review
- Proposed 'short-stack' magnet review
- Vertical plate dimension comparison
- Horizontal plate dimensions
- Guosheng's 'Magnetic Flux Density Comparison'

## CURRENT MAGNET DESIGN

## CURRENT MAGNET DESIGN

- 100 vertical layers of steel plates with a 40 mm gap between layers for detector modules.
- Plates directly supported by structure at the bottom.
- 40 layers of 15 mm plates in front.
- 60 layers of 40 mm plates in back.
- Total approximate weight of steel plates is 958 Tons.

## CURRENT MAGNET DESIGN

- Typical conductor coil for outside plates is shown.

## ‘SHORT STACK’ MAGNET DESIGN

## 'SHORT STACK’ MAGNET DESIGN

- Same number (100) and thickness of vertical layers of steel plates.
- The shorter vertical plates are supported by a stack of horizontal plates.
- 29 layers of 25.4 mm thick horizontal plates are directly supported by structure at the bottom.
- Total approximate weight of steel plates is 1,140 Tons (vs. 958).
- Total approximate weight of vertical steel plates is 815 Tons.

## VERTICAL PLATE DIMENSIONS

- 'Short Stack' plates were trimmed at bottom of lower coil notch.

Current<br>Design

'Short Stack'
Design

## HORIZONTAL PLATE DIMENSIONS

- First layer of horizontal plates is shown.
- Plates are 146.5 in $\times 272$ in x 1 in thick.
- Plates are just over 12 ft wide so can most likely be shipped on a flatbed semi.
- Gap between plates in magnetic analysis is 0.20 in .

Insulation details

- Conductors will wrapped in insulation.
- G-10 will be used to insulate at connections.
