

Towards a Muon Collider Detector

Sergo Jindariani (Fermilab) Apr 13th, 2023 On behalf of US Muon Collider Community, IMCC, and Snowmass Muon Collider Forum

Thank you to everybody who provided input!

Physics Motivation

We need to prepare for higher energies based on data from the LHC

Muon Collider:

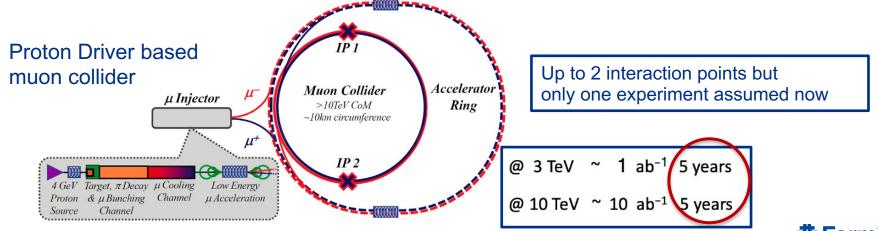

- Versatile machine with incredible EW reach (not just a muon collider)
- Higgs and understanding of EWSB
- Dark Matter

And much more..

The Machine Concept

- The goal is to get to 10+ TeV center-of-mass energy
- Small footprint (can fit at Fermilab) and high energy efficiency
- Energy reach and precision in one machine
- Staging at 3 TeV is the current baseline, other scenarios possible
- Strong synergies with other areas of HEP and Nuclear (see backup)

What changed since the last P5?

- Physics: Strong surge of interest in Muon Colliders within the theoretical and experimental communities. Shift of emphasis in Muon Colliders from 125 GeV to 10 TeV energy.
- Accelerator Technology (more details at the SLAC townhall):
 - Muon Accelerator Program (MAP) results completed and published, including designs of various subsystems
 - Key technological progress: multi-MW proton sources, demonstration of RF in magnetic field, high field solenoids, targets, good solution for neutrino flux mitigation, etc.
 - Muon Ionization Cooling Experiment (MICE) confirmed muon ionization cooling principle, results published
- Detector: Large leap in detector technologies. Feasibility of good quality physics in Muon Collider environment established in simulation
- International Muon Collider Collaboration (IMCC) established. MAP+IMCC put muon collider on a realistic path

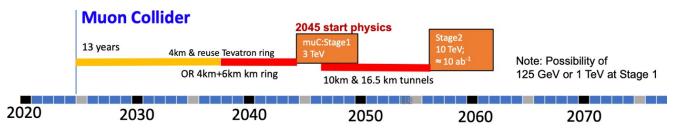

Muon Collider in Snowmass

- Cross-frontier AF+EF+TF Muon Collider Forum :
 - Regular meetings with 50-100 participants in each, workshops
 - 40+ dedicated White Papers
 - Final report with ~180 authors, 50+% from Early Career (<u>arxiv:2209.01318</u>)

 Conclusion of the Forum: No fundamental showstoppers identified, but many engineering challenges exist, requiring a significant R&D investment

The US timeline shown in Snowmass

- not limited by resources/funding
- does not account for R&D risks
- assumes no delays in construction
- The actual project start time is subject to:
 - Successful outcome of the proposed extensive R&D program
 - Availability of funding + resources, host laboratory, and international agreements
- Development will take a long time need to start now!

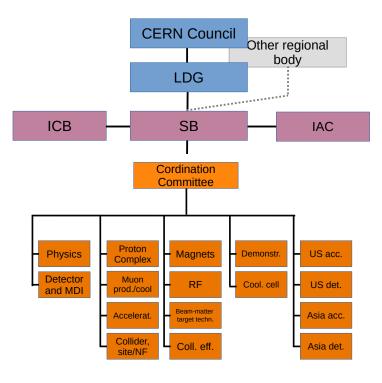

Fermilab ACE+expansions could provide the accelerator frontend

International Effort

- Following the 2018 European Strategy process, European LDG initiated a Muon Collider feasibility study
- International Muon Collider Collaboration (IMCC) was formed and hosted at CERN
- Several US universities joined IMCC, many more expressed interest
- IMCC welcomes broader US participation and development of siting options in both Europe and US

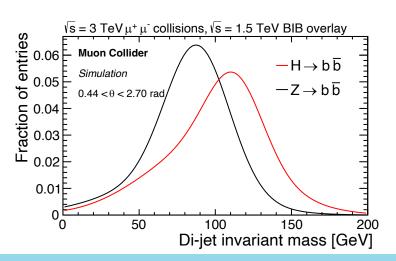

IMCC technical timeline is slightly shifted wit respect to what was presented at Snowmass – will be better aligned if/when DOE/NSF join the effort

Detector Requirements

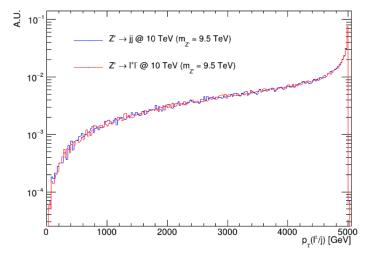

Precision Higgs program:

- High performance tracking for Particle Flow reconstruction
- + Good calorimetric energy resolution → need to separate W/Z from Higgs
- Performant heavy flavor tagging (e.g. H→bb/cc)

BSM program:

- Ability to reconstruct high energy leptons and jets
- Maintain acceptance/efficiency for unconventional signatures (disappearing tracks for DM searches, long-lived particles, etc)

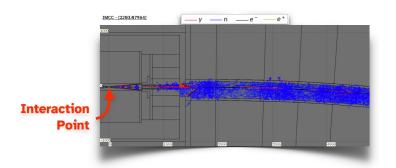

The Detector

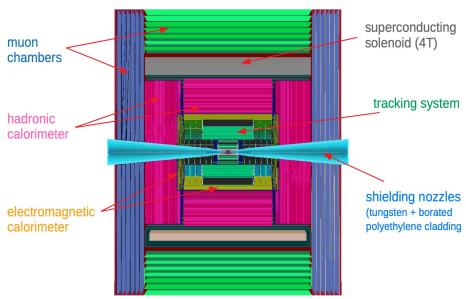

Why do Muon Colliders need specialized detectors?

 Muons decay → Unique feature/challenge of Muon Collider detectors – beam induced background (BIB)

Significant energy in detector is not produced in collision → major effect on the

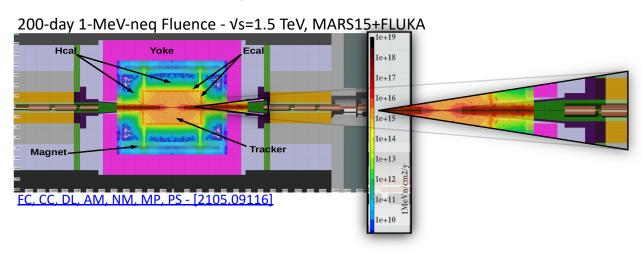

detector design

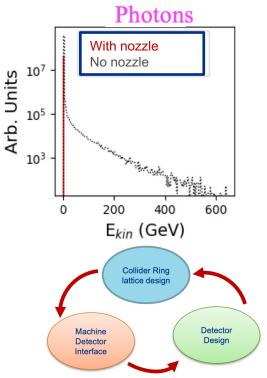

Forward Shielding

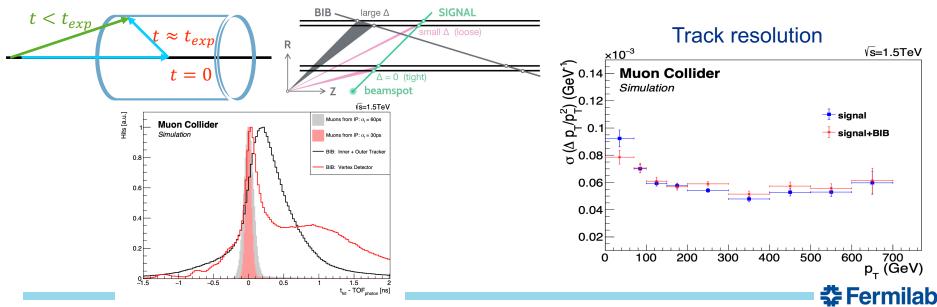

Forward region covered by coated tungsten nozzles:

- Reduces BIB in detector by many orders of magnitude
- Turns highly localized incident energy into diffuse detector energy
- Future nozzle optimization can bring further improvement:
 - materials/shapes/size, collaboration between accelerator and detector experts

Tracker

- Need to build detectors that can tell the difference between post-nozzle BIB and signal
- The BIB is mostly out of time and not pointing to the Interaction Point
- Similarities with LHC pileup can build on the detector experience!
- 4D tracker with precision timing (~30-60 ps) and pointing information

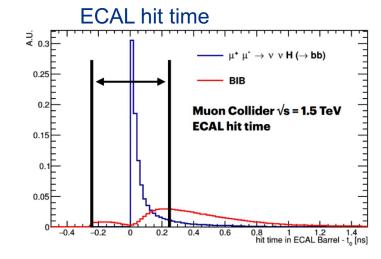

Calorimeter

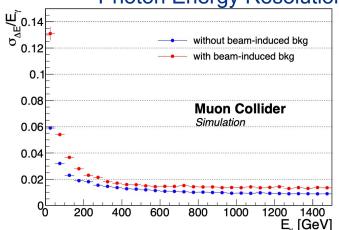

- BIB dominated by low energy neutrals: photons (96%) and neutrons (4%)
- Current SiW ECAL + Iron/Scintillator HCAL design works reasonably well, but new ideas (e.g. dual readout) can bring better performance

General Features:

- High granularity and shorter integration windows
- Hit time measurement O(100ps)
- Longitudinal segmentation

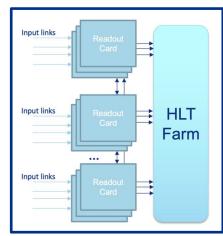

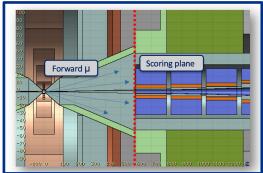

Photon Energy Resolution

Muons, DAQ and Forward Detectors

- Muon system: some technologies are reaching rate limits in the forward region. Also some contain gas mixture which has a high Global Warming Potential
- DAQ: Long time between bunch crossings.
 Estimates indicate that a "streaming" architecture is possible. Various options for how to filter/store data
- Forward Detectors: Just started to investigate possibility of instrumenting the forward region for muon tagging, BSM physics, and for luminosity measurements

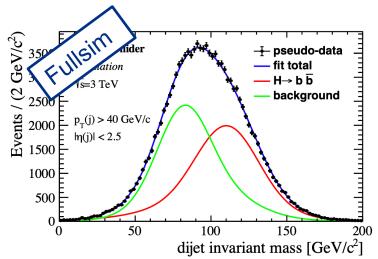

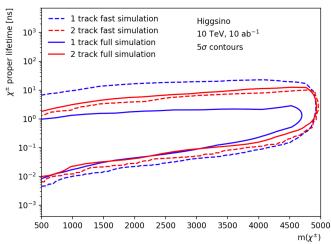

Full Simulation Physics Studies

- Detector requirements designed to meet physics goals
- Many measurements simulated with fully realistic background and reconstruction
- Two very different examples: Higgs→bb cross section and Dark Matter with disappearing tracks → Good agreement with FastSim

Higgs → bb cross-section:

FastSim: 0.73% vs Fullsim: 0.75%

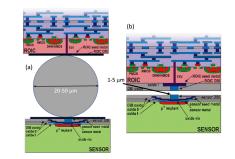

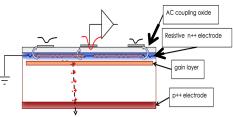

Very good agreement in 2-track final state
1-track better in fastsim due to higher acceptance

R&D Activities:

- 4D Trackers:
 - Design, Sensors, Data Transmission, Power, Mechanics
 - 3D Integration, ASIC, Intelligent Sensors/Modules
- Calorimeters:
 - Different technologies, design, reconstruction (with AI/ML)
 - Integration of precision timing
- Muons:
 - Qualification of new gases, fast timing,...
- TDAQ:
 - Architecture studies
 - Real-time reconstruction, novel readout technologies
- MDI+Forward:
 - MDI Design, Forward Muon Tagger
 - Luminosity Monitor
- Detector magnet coil

arXiv: 2203.07224

Promising Technologies and R&D Directions for the Future Muon Collider Detectors

Submitted to the Proceedings of the US Community Study on the Future of Particle Physics (Snowmass 2021)

Significant synergies with HL-LHC and EIC, e+e-, and pp detectors

Software and Simulations

- Realistic simulation of the BIB is crucial for quantifying the detector performance
- Complex event features due to beam-induced background
- The design, optimization, performance estimation and physics case of a muon collider are expected to require moderate dedicated computational resources.
 - Core software frameworks and analysis tools. Focus on multi-threading; synergies with other future accelerators projects and HL-LHC
 - BIB and shielding simulations (FLUKA, MARS, GEANT) are CPU/disk-intensive. Need accuracy and efficiency. Ideal case for in-development GPU simulation engines
 - Detector layout design and technology evaluation require iterations.
 - Digitization and reconstruction algorithms require detailed studies and production of large samples for realistic physics projections. Balance full/fast simulations.

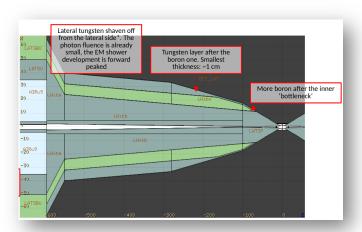

Towards the 10 TeV Detector

- Detector and MDI designs in early stages of development
- The backgrounds remain flat with energy
- Radiation at HL-LHC levels or lower, much lower than FCC-hh

Monte Carlo simulator	FLUKA	FLUKA	FLUKA
Beam energy [GeV]	750	1500	5000
μ decay length [m]	$46.7\cdot 10^5$	$93.5\cdot 10^5$	$311.7 \cdot 10^{5}$
$\mu \mathrm{decay/m/bunch}$	$4.3\cdot 10^5$	$2.1\cdot 10^5$	$0.64 \cdot 10^{5}$
Photons $(E_{\gamma} > 0.1 \text{ MeV})$	$51 \cdot 10^6$	$70 \cdot 10^{6}$	$107 \cdot 10^{6}$
Neutrons $(E_n > 1 \text{ MeV})$	$110 \cdot 10^6$	$91 \cdot 10^{6}$	$101 \cdot 10^{6}$
Electrons & positrons ($E_{e^{\pm}} > 0.1 \text{ MeV}$)	$0.86 \cdot 10^{6}$	$1.1 \cdot 10^{6}$	$0.92 \cdot 10^{6}$
Charged hadrons $(E_{h^{\pm}} > 0.1 \text{ MeV})$	$0.017\cdot 10^6$	$0.020 \cdot 10^{6}$	$0.044 \cdot 10^{6}$
Muons $(E_{\mu^\pm}>0.1~{ m MeV})$	$0.0031 \cdot 10^6$	$0.0033 \cdot 10^6$	$0.0048 \cdot 10^6$

[IMCC, Submitted to EPJC]

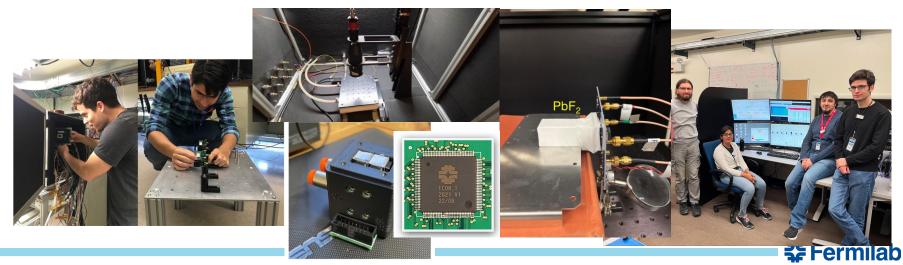

Initial 10 TeV nozzle optimization = 20% lower BIB

Training Opportunities

- Unique training ground for future generations of particle physicists:
 - Simulation → design → component R&D → prototyping
 - Great opportunities for labs and University groups to engage in exciting R&D
- Cutting edge technology + highly impactful research = Draw the best talent
- Strong interest amongst Early Career community build a diverse community of future US particle physics leadership!

US Muon Collider R&D Coordination Group

- In March, R&D Coordination Group was assembled to provide input to P5
- Focus on key elements of 10 TeV accelerator and detector design
- Develop R&D plan, activities, budget and deliverables

Chairs: Sergo Jindariani, Diktys Stratakis (FNAL), Sridhara Dasu (Wisconsin)

Detector R&D Focus Areas:

Tracking Detectors:

Maurice Garcia-Sciveres (LBNL), Tova Holmes (Tennessee)

Calorimeter Systems

Chris Tully (Princeton), Rachel Yohay (FSU)

Muon Detectors

Melissa Franklin (Harvard), Darien Wood (Northeastern)

Electronics/TDAQ

Darin Acosta (Rice), Michael Begel (BNL), Isobel Ojalvo (Princeton),

MDI+Forward Detectors:

Kevin Black (Wisconsin), Karri DiPetrillo (Chicago), Nikolai Mokhov (Fermilab)

Detector Software/Simulations/ML:

Simone Pagan Griso (LBNL), Walter Hopkins (ANL), Liz Sexton-Kennedy (Fermilab)

+ maintained communication links with DOE, CPAD, ECFA

Physics Case Development:

Patrick Meade (Stony Brook), Nathaniel Craig (UCSB)

Accelerator R&D Focus Areas:

Muon source:

Mary Convery (Fermilab), Jeff Eldred (Fermilab), Sergei Nagaitsev (JLAB), Eric Prebys (UC Davis)

Machine design:

Frederique Pellemoine (Fermilab), Scott Berg (BNL), Katsuya Yonehara (Fermilab)

Magnet systems:

Steve Gourlay (Fermilab), Giorgio Apollinari (Fermilab), Soren Prestemon (LBNL)

RF systems:

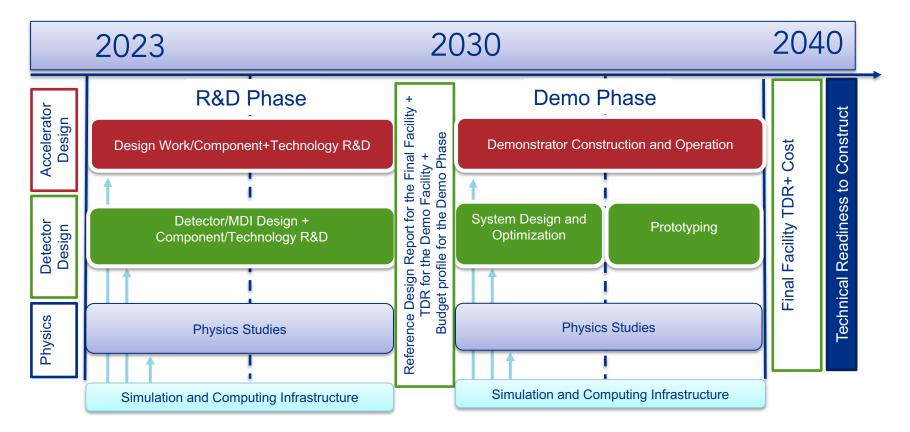

Sergey Belomestnykh (Fermilab), Spencer Gessner (SLAC), Tianhuan Luo (LBNL)

International Liaisons:

Donatella Lucchesi (INFN), Federico Meloni (DESY), Chris Rogers (RAL), Daniel Schulte (CERN),

US Muon Collider R&D timeline

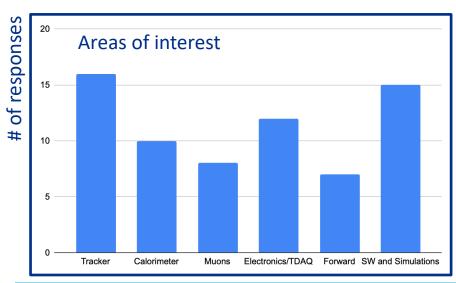

Detector R&D Scope and Interest:

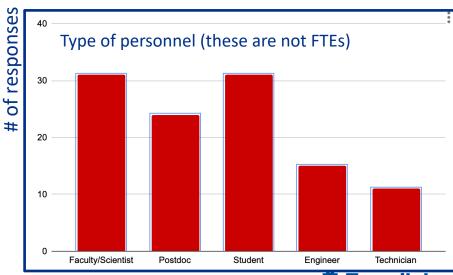

Link to the work areas and list of activities

The scope of detector work:

- Support and enhancement of the fullsim framework and tools
- Develop detector + MDI design, simulate the performance, refine detector specs
- Conduct hardware R&D to establish technology feasibility

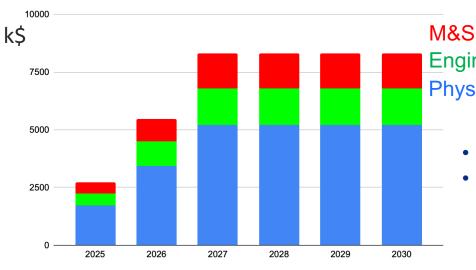

Expression of interest from 31 PIs from 24 US institutions (does not include theorists and accelerator physicists)

Detector R&D Budget Estimate

- Assumes ~50% of needed work done by US and another ~50% by international partners → equal partnership with European efforts
- 2025-2030: ramp up to ~ 30-35 FTE/y + M&S for computing and early hardware
 - 1 FTE = \$200k, no escalation included
 - Significant overlaps exist with generic detector R&D efforts

Engineer Labor
Physicist Labor

Physicist Labor

- 2031-2035: estimate to increase by ~50%
- 2036+: another increase, hard to quantify at this stage

Summary

- Muon colliders open an exciting window into the future of particle physics
- We have a well-organized and highly motivated group ready to work on the challenges of Muon Collider
- We are asking P5 to:
 - Recommend establishing a Muon Collider R&D program with the goal for technical readiness by 2040
 - Recommend that DOE and NSF recognize muon collider work within the EF base program proposals, including software and simulations
 - Support the formation of a US Muon Collider effort to coordinate US impact while engaging in global efforts
 - Enable US to compete for hosting a global Muon Collider
- We are also asking for support of the theory community for Muon Collider studies

Fermilab ACE and Muon Collider

- ACE is a step in right direction (power increase at 120 GeV requires power increase at 8 GeV as muon collider needs).
- ACE infrastructure is compatible with the Muon Collider R&D needs (though needs to be expanded)
- ACE will provide an excellent platform for Muon Collider accelerator and detector R&D
- ACE Booster replacement is to be designed such that it is compatible with the Muon Collider Facility needs (also, will need to be expanded)

Booster Replacement Scenarios

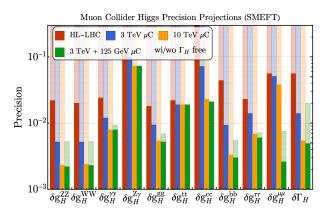

- Initial scenarios under explorations included cases where available 8 GeV power is in 1-2 MW range
- Exact parameters still to be defined, including input from the upcoming ACE physics workshops

	Nominal	New RCS Scenarios			8 GeV Linac Scenarios		
Parameter		v1	v2	v3	v1	v2	v3
Linac Energy	0.8 GeV	2 GeV	2 GeV	2 GeV	8 GeV	8 GeV	8 GeV
Linac Current	2 mA	2 mA	2 mA	5 mA	2.7 mA	5 mA	5 mA
Rep. Rate	20 Hz	10 Hz	20 Hz	20 Hz	10 Hz	10 Hz	20 Hz
8 GeV Beam Power	160 kW	320 kW	960 kW	960 kW	320 kW	760 kW	1600 kW

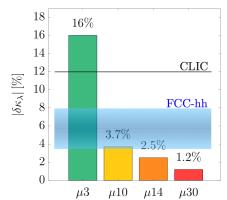

Parameter	PIU scenarios	MuC-PD scenarios
Energy	8 GeV	8-16 GeV
Rep. rate	10-20 Hz	5-20 Hz
Avg. beam power	0.3-1.6 MW	1-4 MW
Proton structure	$25-40 \text{ e}12 \text{ over } 2 \mu \text{s ring}$	40-120 e12 in four 1-3 ns bunches

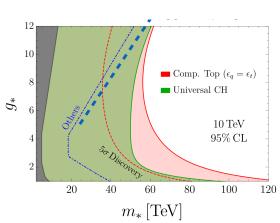

Muon Collider Physics

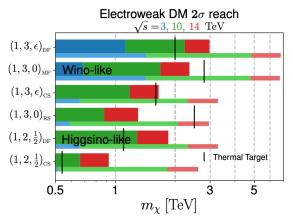

Order of magnitude in Higgs precision wrt HL-LHC and can directly probe the scale implied in same machine!

Self-coupling: at 3 TeV better than LHC. At 10 TeV similar or better than FCC-hh.

Covers *simplest* WIMP candidates hard or impossible with next gen DM direct detection

Unprecedented reach for strongly motivated BSM scenarios

Muon Collider in Snowmass

A concept of 10 TeV Muon Collider at Fermilab developed

Proton source

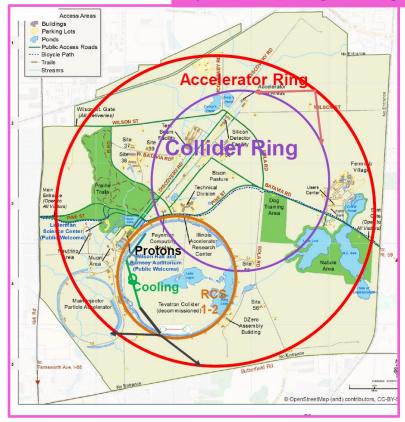

• PIP-II → PIU → Target → Cooling

Acceleration (3 stages)

- Linac + Recirculating Linac → 65 GeV
- Rapid Cycling Synchrotrons #1, #2 → 1 TeV (Tevatron tunnel?)
- RCS #3 \rightarrow 5 TeV (site filler)
- 10 km collider ring

Various staging scenarios possible

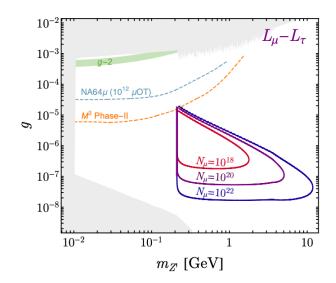

By D. Neuffer, [Details]

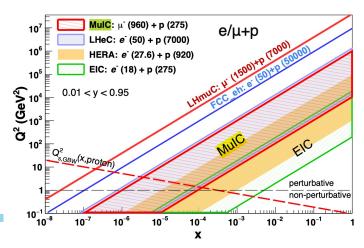

Muon Collider Synergies

- Variety of Neutrino synergies:
 - Short baseline (x-sections, sterile)
 - Long baseline neutrino factory
 - High energy neutrino cross sections
 - BSM physics → FASERv like experiment with smaller flux uncertainties
- Charged Lepton Flavor Violation
- Beam dump experiments
- Low mass DM
- Muon-Ion collider
- Non-HEP applications

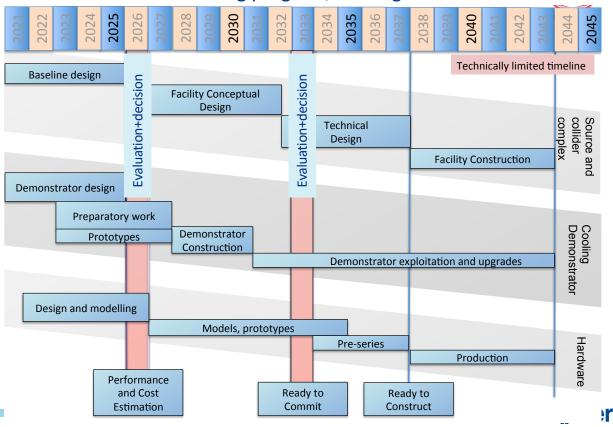

IMCC Technically Limited Timeline

Muon collider important in the long term

Prudently explore if MuC can be **option as next project**

- e.g. in Europe if higgs factory built elsewhere
- sufficient funding required now
- very strong ramp-up required after 2026
- might require compromises on initial scope and performance
 - 3 TeV

To be reviewed considering progress, funding and decisions

IMCC Collaboration Organisation

- Collaboration Board (ICB)
 - Chair: Nadia Pastrone
- Steering Board (ISB)
 - Chair Steinar Stapnes
 - Reports to LDG but could add DOE
- Advisory Committee (IAC)
 - To be defined
- Coordination committee (CC)
 - Study Leader Daniel Schulte
 - Deputies: Andrea Wulzer, Donatella Lucchesi, Chris Rogers
 - Sergo Jindariani, Mark Palmer as US links
 - Will strengthen physics and detectors
