Coherent Synchrotron Radiation (CSR)

- AAC, FEL applications need highly compressed beams longitudinally
- Dispersive lattices are used to compress the beams (e.g., chicanes)
- Coherent synchrotron radiation (CSR) is produced when bending beam trajectory

A. Edelen et al., IPAC 2022

CSR Degrades Beam Quality

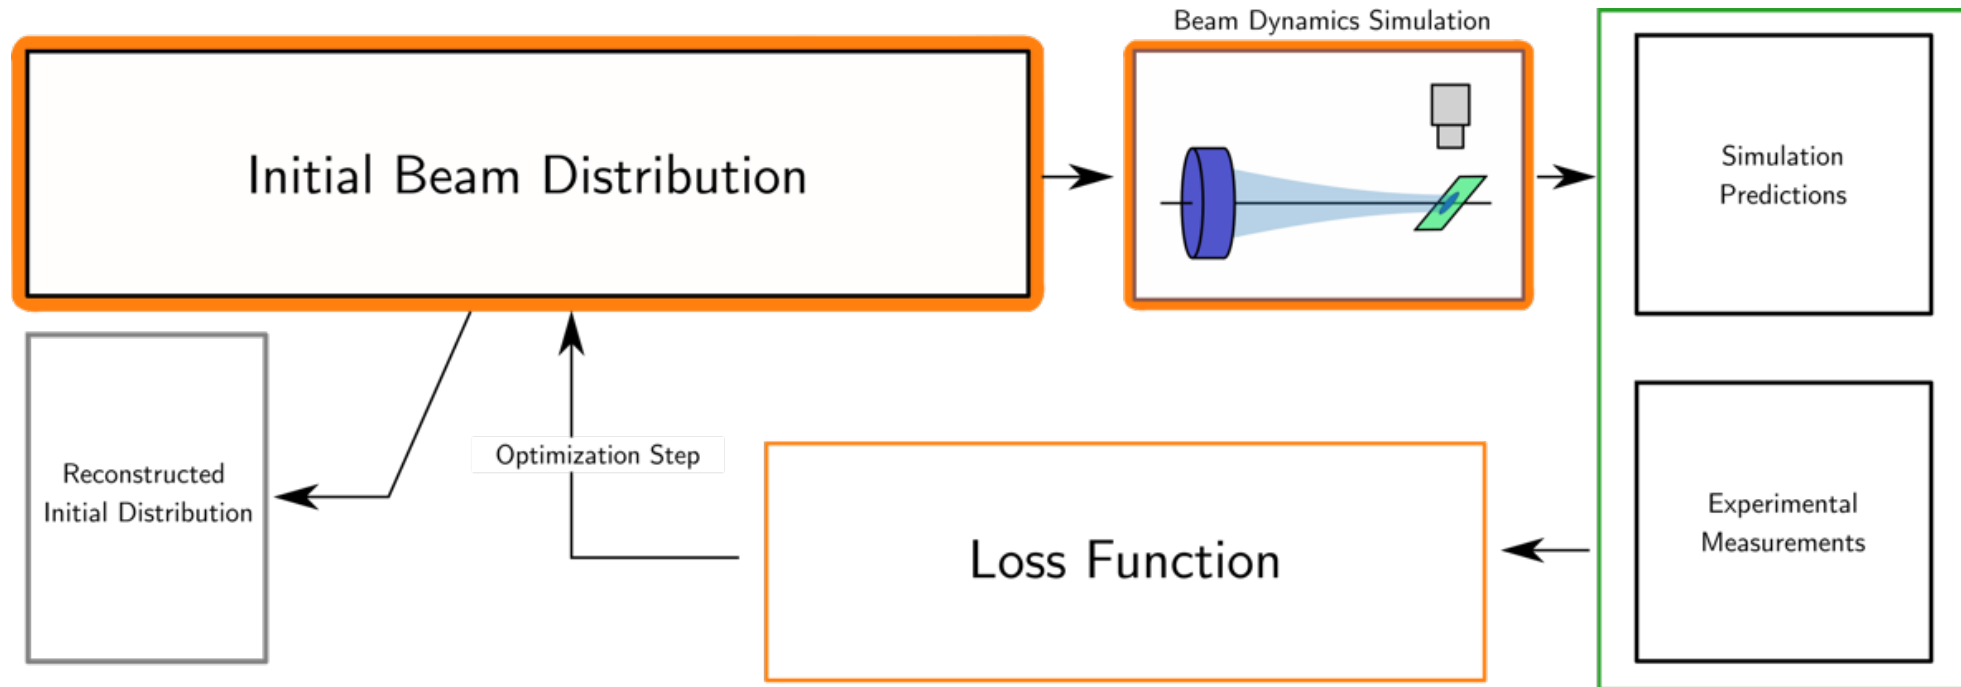

- Short-range CSR wakefield induces nonlinear kick in E vs z
- Dipoles also introduce x, p_x correlations with E
- **Result: rotation and centroid shift of x, p_x longitudinal slices, increasing the projected ε_x**

6D Generative Phase Space Reconstruction

(1) Use **generative machine learning** to represent complex 6D beam distributions.

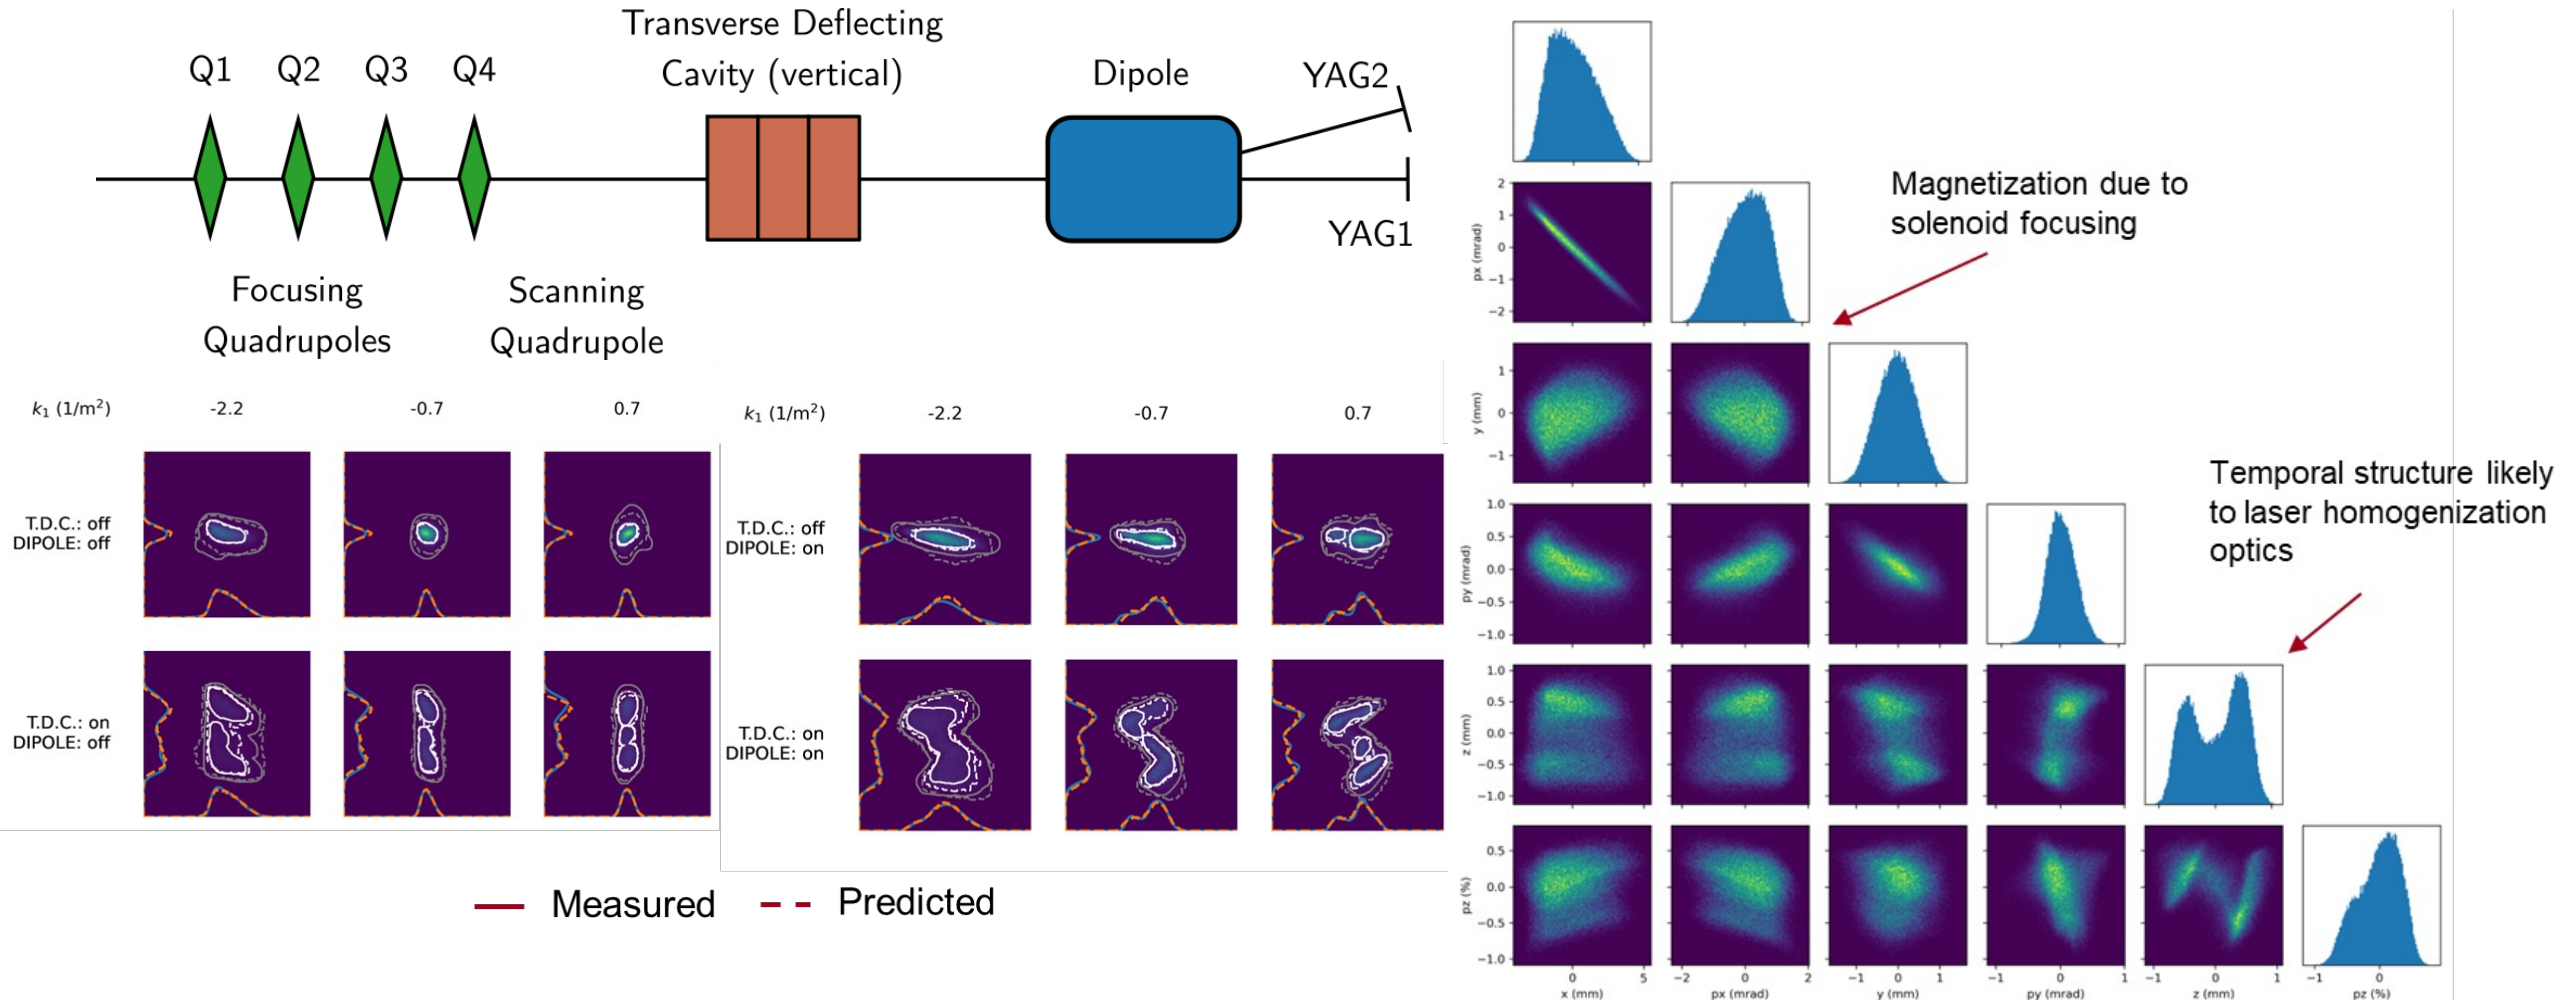

(2) Implement **differentiable** beam dynamics simulations to enable learning

Analogous to quadrupole scan analysis

6D Generative Phase Space Reconstruction

- Perform 6-dimensional phase space reconstruction of a beam distribution from 20 experimental measurements (no pre-training)

CSR at the Argonne Wakefield Accelerator

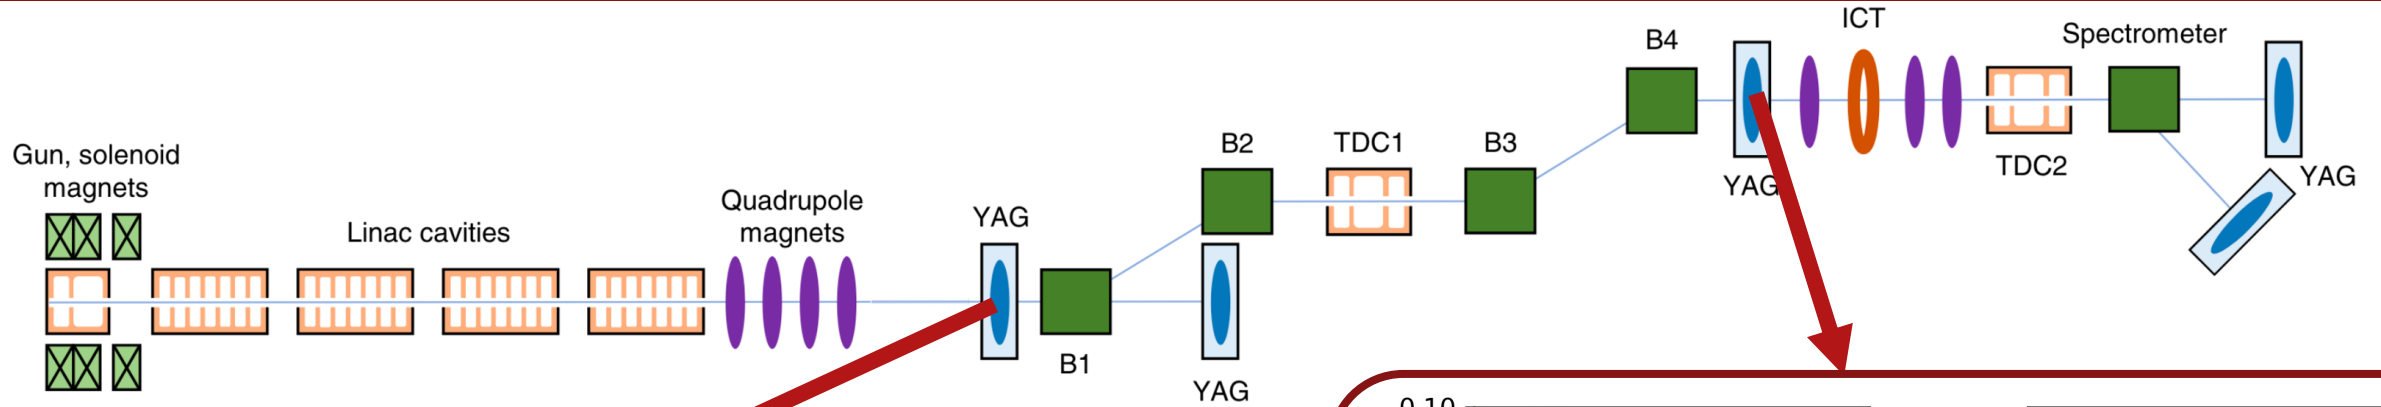

- Generate a beam influenced by CSR in double dogleg
- Measure phase space after 4th dipole with beam diagnostics

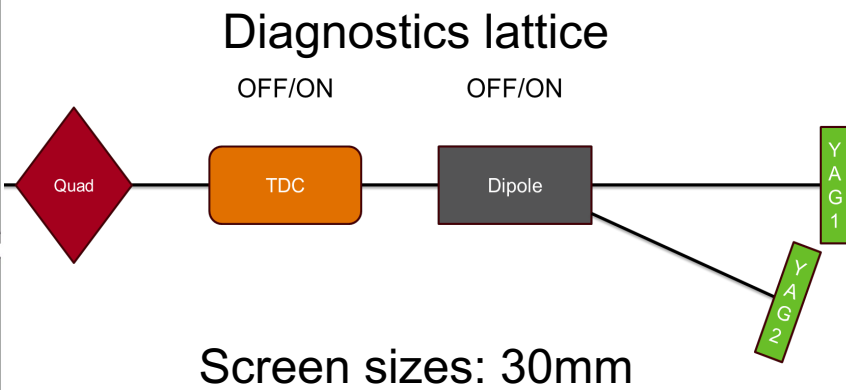

First double dogleg:
4 dipoles

Adapted from *N. Majernik et al., PRAB, 2023.*

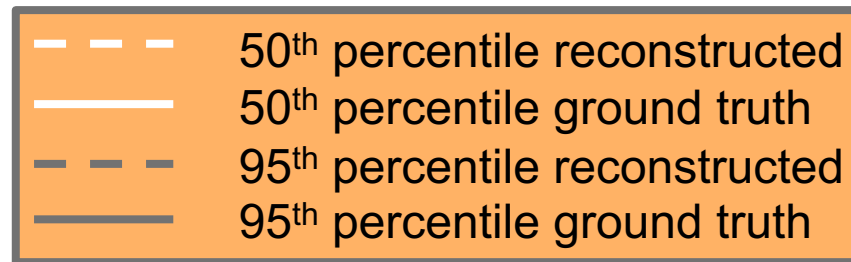

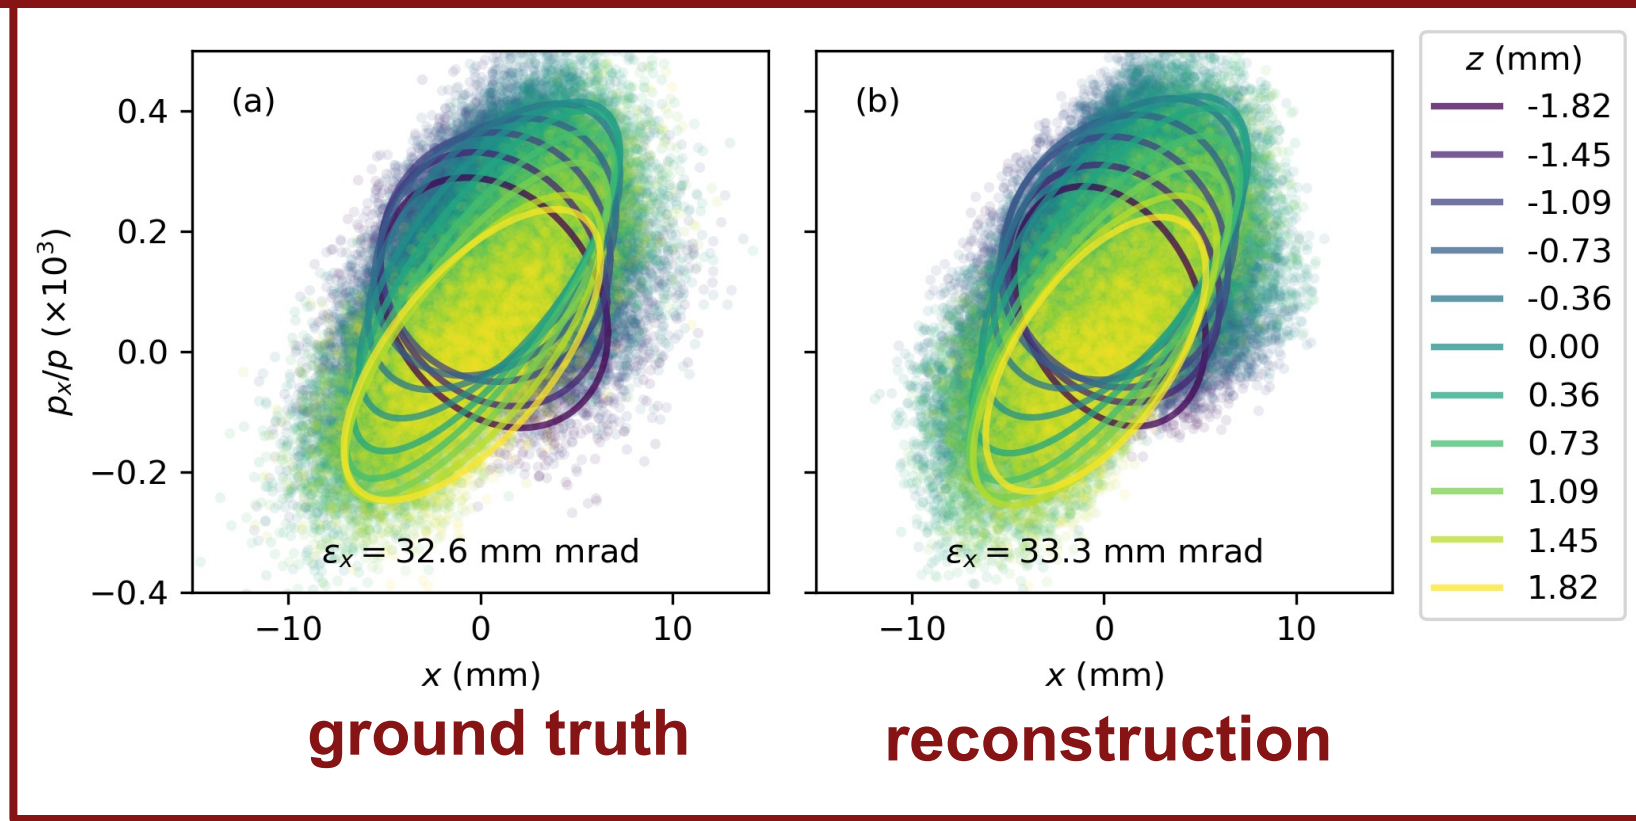

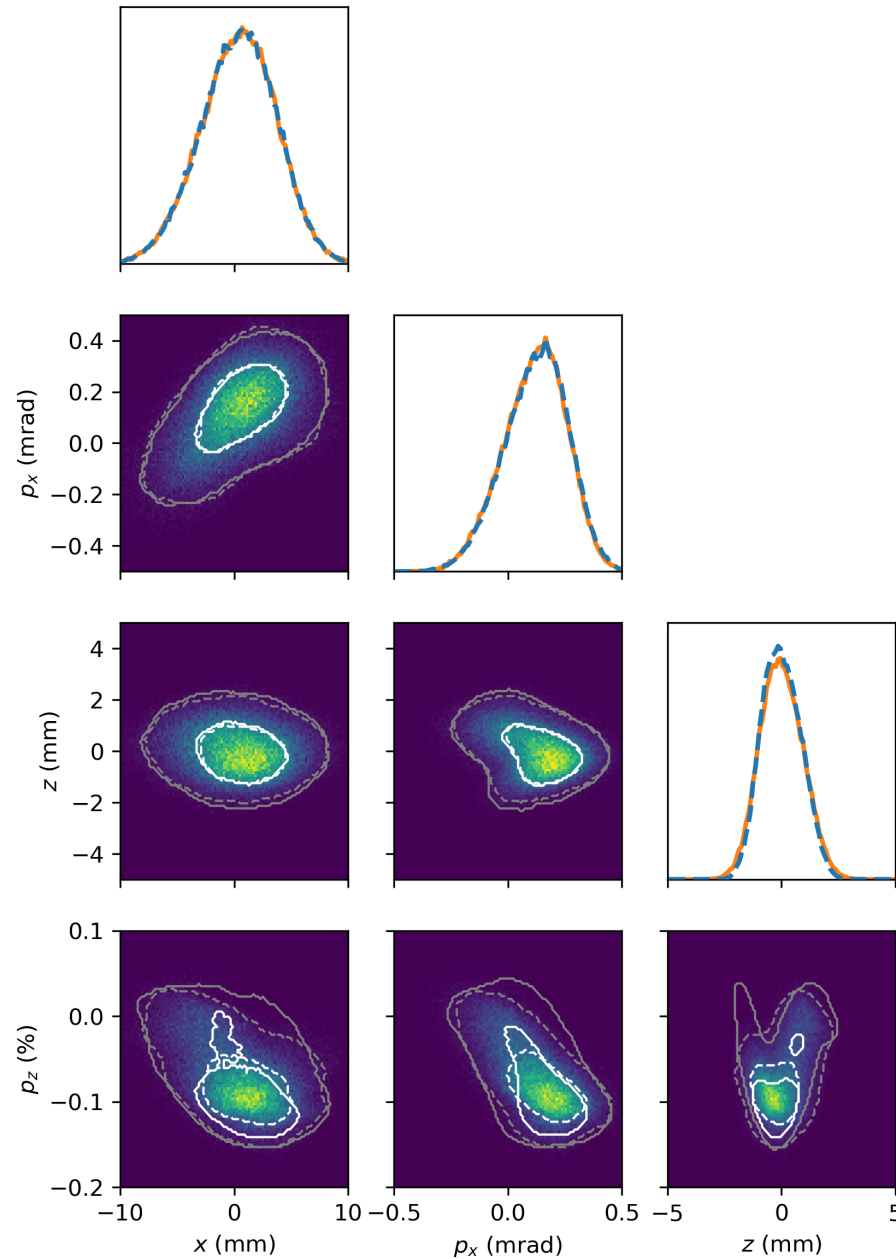

Simulated CSR Effects: $E - z$ and $x - p_x$

GPSR Training Data

GPSR Results

Summary

- AWA double dogleg can produce significant CSR effects
- Simulations show 6D GPSR can resolve CSR effects in the $\varepsilon_x = 25 \text{ mm mrad}$, $\sigma_\delta = 0.2\%$ case
 - Only 20 x-y beam profiles
 - ~10 min, 8 Gb GPU
- Experimental demonstration coming soon!

Parameter table

➤ At the end of the drive linac section

Parameters	Short pulse case (0.3 ps)	Long pulse case (6.0 ps)
RMS beam size	0.45 mm (without quads)	0.3 mm (without quads)
RMS bunch length	0.4 mm	0.64 mm
RMS energy spread	0.43%	0.25%
Normalized emittance	3.6 mm mrad	2.3 mm mrad
