

LFU tests in semileptonic decays at LHCb

Tuesday, 4 June 2024 15:00 (30 minutes)

The semileptonic decays of b-hadrons are a rich source of observables sensitive to Standard Model and New Physics parameters.

In the last decade, measurements of ratios of decay rates between the tauonic and the muonic tree level $b \rightarrow c$ transitions, have hinted at potential violations of the Lepton Flavour Universality, which require further investigation.

This talk presents the most recent results of LFU tests performed studying the semileptonic $b \rightarrow c$ transitions at LHCb:

the ratios of branching fractions of $B \rightarrow D(*)\tau\nu$ and $B \rightarrow D(*)\mu\nu$ decays, and the measurement of the D^* longitudinal polarization in $B \rightarrow D^*\tau\nu$ decays.
