

# Recent charm meson results at BESIII

Innes Mackay on behalf of the BESIII collaboration

[innes.mackay@physics.ox.ac.uk](mailto:innes.mackay@physics.ox.ac.uk)

# Introduction to the BESIII experiment

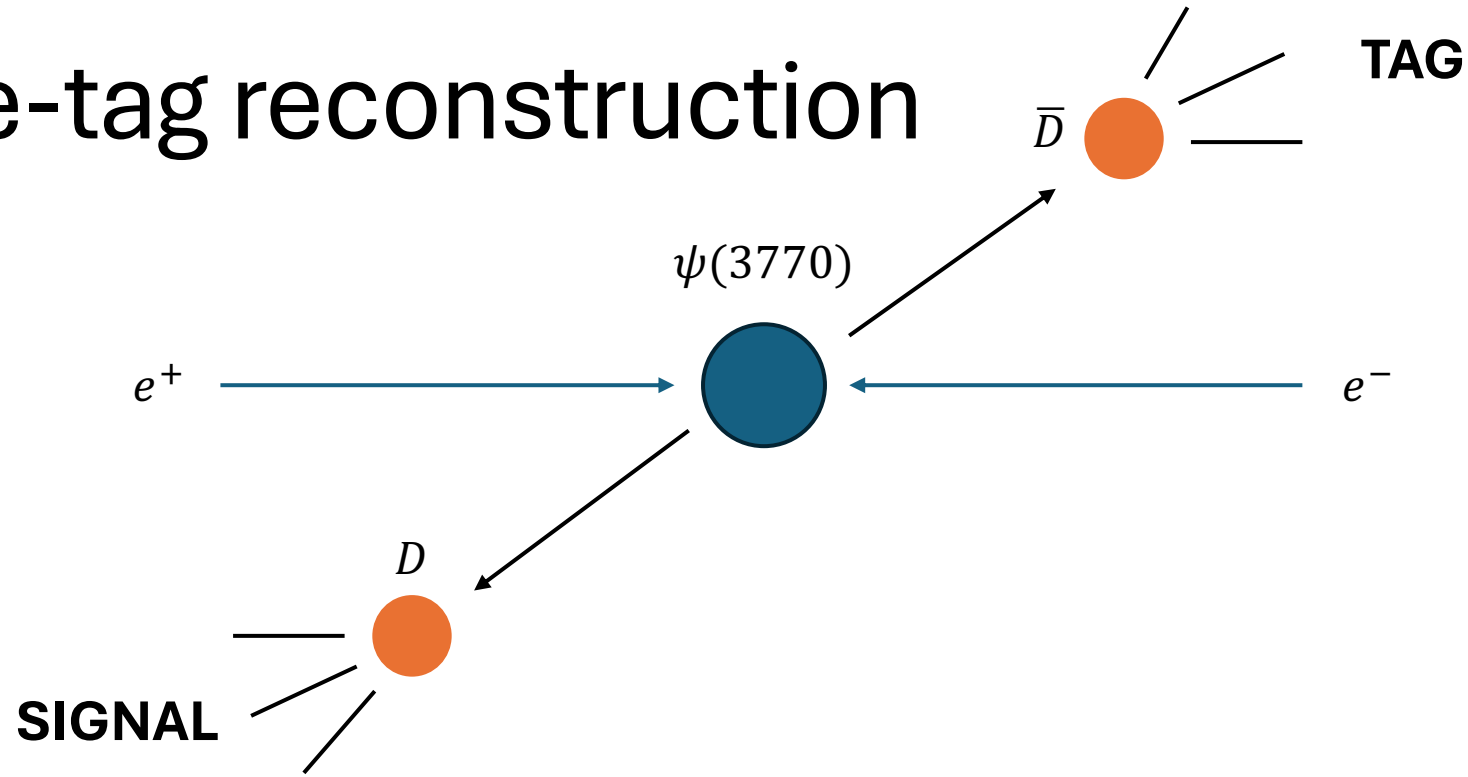

- Located in the symmetric  $e^+e^-$  BEPCII collider at IHEP, Beijing
- Operates in  $E_{CM} = 2 - 5$  GeV with peak  $L \sim 10^{33} \text{ cm}^{-2}\text{s}^{-1}$
- The detector has  $\sim 93\%$  radial acceptance optimised for low momentum particles ( $\sim 1$  GeV)
- R-value,  $\tau$ , **charm**, light hadron, charmonium physics + more

Innes Mackay, BEACH 2024

# Double-tag reconstruction

- Producing two D mesons on resonance allows for clean reconstruction
- Allows use of beam constrained and missing mass/energy variables
- Can determine branching fractions without knowledge of  $N_{DD}$

$$B(D \rightarrow \text{signal}) = \frac{N_{\text{sig}}/\epsilon_{\text{tag \& sig}}}{N_{\text{tag}}/\epsilon_{\text{tag}}}$$

# Observation of $D^+ \rightarrow K_S^0 a_0(980)^+$

[Phys. Rev. Lett. \*\*132\*\*, 131903](#)

- Hadronic charm decays not yet accurately described by theory
- The diagrammatic approach<sup>1</sup> works for  $D \rightarrow PP$  and  $D \rightarrow VP$  decays but progress in  $D \rightarrow SP$  is limited due to W-annihilation amplitudes
- $D^+ \rightarrow K_S^0 a_0(980)^+$  contains no contributions from W-annihilation diagrams
- Discrepancies from predicted BF could tell us more about the  $a_0$

[1] [Phys. Rev. Lett. \*\*56\*\*, 1655](#)

# Observation of $D^+ \rightarrow K_S^0 a_0(980)^+$

- Observed in an amplitude analysis of  $D^+ \rightarrow K_S^0 \pi^+ \eta$  decays using  $2.93 \text{ fb}^{-1}$  data collected at  $E_{\text{CM}}=3.773 \text{ GeV}$
- Highly pure sample of  $\sim 1100$  signal candidates obtained using the 6 hadronic DT final states method
- $B(D^+ \rightarrow K_S^0 a_0(980)^+, a_0^+ \rightarrow \pi^+ \eta) = (1.33 \pm 0.05_{\text{stat}} \pm 0.04_{\text{syst}})\%$

# Search for purely leptonic $D_s^{*+} \rightarrow e^+ \nu_e$ decays

[Phys. Rev. Lett. \*\*131\*\*, 141802](#)

- The decay has never been observed but can be excellent probes of  $c \rightarrow s$  transitions, CKM unitarity and LFU
- QCD effects absorbed into  $f_{D_s^{*+}}$  which provides test of LQCD

$$\Gamma(D_s^{*+} \rightarrow \ell^+ \nu_\ell) = \frac{G_F^2}{12\pi} |V_{cs}|^2 f_{D_s^{*+}}^2 m_{D_s^{*+}}^3 \left(1 - \frac{m_{\ell^+}^2}{m_{D_s^{*+}}^2}\right)^2 \times \left(1 + \frac{m_{\ell^+}^2}{2m_{D_s^{*+}}^2}\right),$$

- Measurement uses  $7.33 \text{ fb}^{-1}$  data collected between  $E_{\text{CM}}=4.128\text{-}4.226 \text{ GeV}$  where  $e^+e^- \rightarrow D_s^- D_s^{*+}$  production is possible
- Double-tag method used with 16 hadronic  $D_s^-$  decays

# Search for purely leptonic $D_s^{*+} \rightarrow e^+ \nu_e$ decays

- Signal yield extracted from a fit to the squared missing mass

$$M_{\text{miss}}^2 \equiv \left| E_{\text{cm}} - \sum_k E_k \right|^2 / c^4 - \left| \sum_k \vec{p}_k \right|^2 / c^2$$

where k loops over all particles used in reconstruction

- **First evidence for this decay and measurement of decay constant**
- $BF(D_s^{*+} \rightarrow e^+ \nu_e) = (2.1_{-0.9}^{+1.2}_{\text{stat}} \pm 0.2_{\text{syst}}) \times 10^{-5}$  ( $< 4 \times 10^{-5}$  at 90%CL)

Innes Mackay, BEACH 2024

# Measurement of $D_s^+ \rightarrow \mu^+ \nu_\mu$

[Phys. Rev. D \*\*108\*\*, 112001](#)

- Measure  $|V_{cs}|$ , LFU tests and LQCD checks

$$\Gamma_{D_s^+ \rightarrow \ell^+ \nu_\ell} = \frac{G_F^2}{8\pi} |V_{cs}|^2 f_{D_s^+}^2 m_\ell^2 m_{D_s^+} \left( 1 - \frac{m_\ell^2}{m_{D_s^+}^2} \right)^2$$

- Measurement uses  $7.33 \text{ fb}^{-1}$  data collected between  $E_{\text{CM}}=4.128\text{-}4.226 \text{ GeV}$  where  $e^+e^- \rightarrow D_s^+ D_s^{*-}$  production is possible
- Double-tag method used with 16 hadronic  $D_s^-$  decays with fully reconstructed  $D_s^{*-} \rightarrow D_s^- \gamma$  or  $D_s^- \pi^0$

# Measurement of $D_s^+ \rightarrow \mu^+ \nu_\mu$

- Branching fraction determined using yields from fit to  $M_{\text{miss}}^2$

- Determine  $B(D_s^+ \rightarrow \mu^+ \nu_\mu) = (0.5294 \pm 0.0108)\%$

$$\mathcal{B}_{D_s^+ \rightarrow \mu^+ \nu_\mu} = \frac{N_{\text{DT}}}{N_{\text{ST}} \cdot \epsilon_{\gamma(\pi^0)\mu^+ \nu_\mu}}$$

With input for  $f_{D_s^+}$ :  $|V_{cs}| = 0.968 \pm 0.010_{\text{stat}} \pm 0.009_{\text{syst}}$

With input for  $|V_{cs}|$ :  $f_{D_s^+} = 248.4 \pm 2.5_{\text{stat}} \pm 2.2_{\text{syst}}$  MeV

BESIII results:  $\frac{B(D_s^+ \rightarrow \tau^+ \nu_\tau)}{B(D_s^+ \rightarrow \mu^+ \nu_\mu)} = 10.05 \pm 0.35$

Theoretical prediction = 9.75

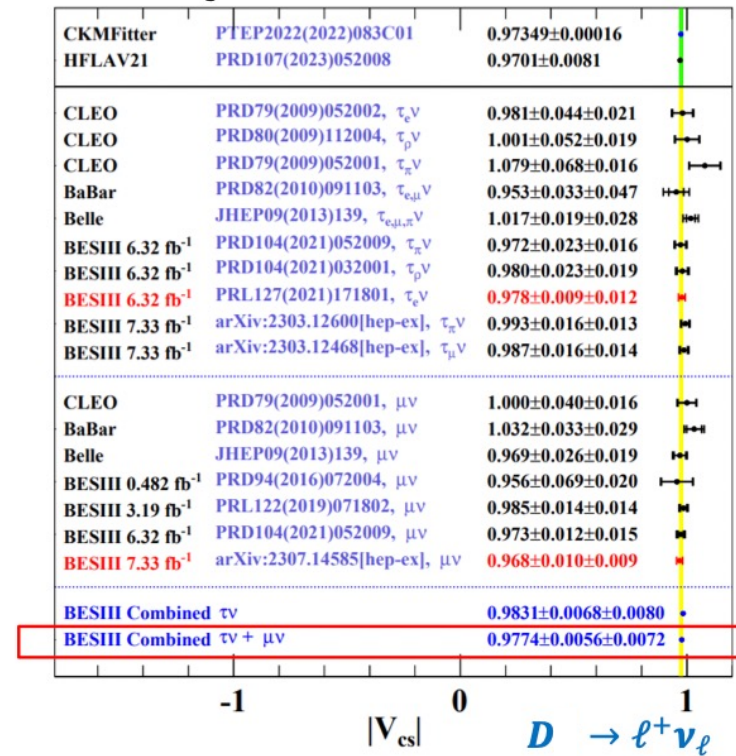

# Comparison of $|V_{cs}|$

- ▶ With the values of  $G_F, m_{D_S^+}, m_\tau, m_\mu$  [PDG2022]
- ▶ Input  $f_{D_S^+} = 249.9(0.5), f_+^{K(0)} = 745.2(3.1), f_+^{\eta(0)} = 0.495(5)$  and  $f_+^{\eta'(0)} = 0.558^{(+47)}_{-45}$

Phys. Rev. D **104**, 034505

$f_+^{D \rightarrow K(0)}$  @HPQCD2021

precision: 2.4%  $\rightarrow$  0.6%

**With the highest precision: 0.9%**

The third uncertainty includes systematic uncertainty and uncertainty from LQCD

# Quantum correlated $D^0\bar{D}^0$ pairs

$$\mathcal{A} = \langle S|D^0\rangle\langle T|\bar{D}^0\rangle - \langle T|D^0\rangle\langle S|\bar{D}^0\rangle$$

- $e^+e^- \rightarrow \psi(3770)$  proceeds through  $\gamma^*$  which is C-odd -- conserved in final state so decays of the  $D^0$  and  $\bar{D}^0$  are correlated
- Interference between the  $D^0$  and  $\bar{D}^0$  decays is sensitive to the strong-phase difference in the signal and tag final states
- Key inputs in measurements of the CKM angle  $\gamma$  and charm mixing and CPV parameters

# Measurement of the CP even fraction of $D^0 \rightarrow K_S^0 \pi^+ \pi^- \pi^0$

- C-odd constraint places CP restrictions on the final states

[Phys. Rev. D \*\*108\*\*, 032003](#)

$$|D^0 \bar{D}^0\rangle - |\bar{D}^0 D^0\rangle = |D_- D_+\rangle - |D_+ D_-\rangle$$

- Allows for measurement of the CP even fraction ( $F_+$ ) in a decay, which is key input to measurements of the CKM angle  $\gamma$
- Multiple different tag final states are used with different CP properties

Type	Tag modes
<i>CP</i> -even	$K^+ K^-, \pi^+ \pi^-, K_S^0 \pi^0 \pi^0, K_L^0 \omega, K_L^0 \pi^0$
<i>CP</i> -odd	$K_S^0 \pi^0, K_S^0 \eta(\gamma\gamma), K_S^0 \eta'(\eta\pi^+ \pi^-), K_S^0 \eta'(\gamma\pi^+ \pi^-)$
Quasi- <i>CP</i>	$\pi^+ \pi^- \pi^0, \pi^+ \pi^- \pi^+ \pi^-$
Mixed <i>CP</i>	$K_{S,L}^0 \pi^+ \pi^-$
Self-tag	$K_S^0 \pi^+ \pi^- \pi^0$

# Measurement of the CP even fraction of $D^0 \rightarrow K_S^0 \pi^+ \pi^- \pi^0$

- $F_+$  is determined using 5 CP even and 4 CP odd tags
- Single tags used for cancellation of systematic uncertainties and  $N_{D\bar{D}}$
- Fit to  $M_{BC}$  ( $M_{miss}^2$ ) for tags without (with)  $K_L^0$  particles
- Similar procedure for the quasi-CP tags e.g.  $\pi^+ \pi^- \pi^0$

$$R^{\mp} = \frac{N(S|T)}{N(T)} = BF(S)\epsilon(S)[1 - \eta_T^{\pm}(2F_+ - 1)]$$

where  $\eta_T^{\pm}$  is the CP eigenvalue of the tag

$$F_+ = \frac{R^+}{R^+ + R^-}$$

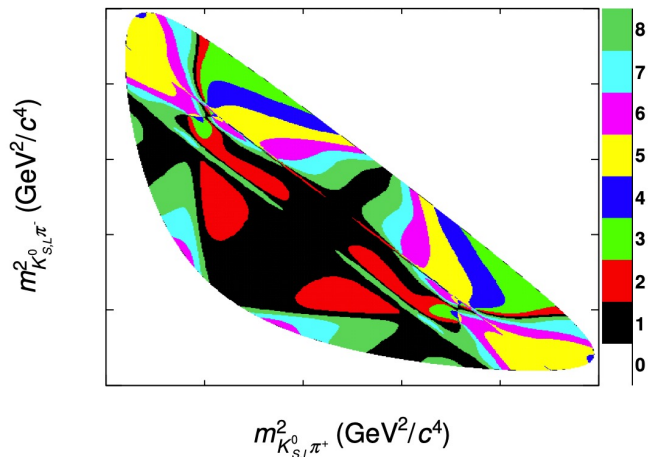

# Measurement of the CP even fraction of $D^0 \rightarrow K_S^0 \pi^+ \pi^- \pi^0$

- Integrated  $F_+^{K_S^0, L \pi^+ \pi^-} \sim 0.5$  so measurement performed in PS regions
- Symmetric 16 bin scheme is used to describe the PS

$$M_i = h \left[ K_i + K_{-i} - 2c_i \sqrt{K_i K_{-i}} (2F_+ - 1) \right]$$

- Likelihood fit to the double tag yields performed to determine  $F_+$  with Gaussian constrained  $K_i, c_i$

Method	$F_+$
<i>CP</i> -tag modes	$0.229 \pm 0.013 \pm 0.002$
$\pi^+ \pi^- \pi^0$ tag mode	$0.227 \pm 0.014 \pm 0.003$
$\pi^+ \pi^- \pi^+ \pi^-$ tag mode	$0.227 \pm 0.016 \pm 0.003$
Self-tag modes	$0.244 \pm 0.019 \pm 0.002$
$K_{S,L}^0 \pi^+ \pi^-$	$0.244 \pm 0.021 \pm 0.006$
Combined	$0.235 \pm 0.010 \pm 0.002$

# Measurement of the CP even fraction of $D^0 \rightarrow K^+ K^- \pi^+ \pi^-$

- Same procedure as in  $D^0 \rightarrow K_S^0 \pi^+ \pi^- \pi^0$
- $F_+ = 0.730 \pm 0.037$  (stat.)  $\pm 0.021$  (syst.)

Category	Tag modes
CP even	$K^+ K^-$ , $\pi^+ \pi^-$ , $K_S^0 \pi^0 \pi^0$ , $\pi^+ \pi^- \pi^0$ , $K_L^0 \pi^0$
CP odd	$K_S^0 \pi^0$ , $K_S^0 \eta_{\gamma\gamma}$ , $K_S^0 \eta'(\pi\pi\eta)$ , $K_S^0 \eta'(\rho^0\gamma)$ , $K_S^0 \omega$
Mixed CP	$K_S^0 \pi^+ \pi^-$ , $K_L^0 \pi^+ \pi^-$

# Measurement of U-spin breaking parameters in $D^0 \rightarrow K_L^0 \pi^+ \pi^-$

- Interference between CF and DCS contributions to the  $D^0 \rightarrow K_L^0 (\pi^+ \pi^-)_{k_{CP}}$  final state can break U-spin symmetry
- $D \rightarrow K_S^0 \pi^+ \pi^-$  strong-phases measured using  $K_L^0 \pi^+ \pi^-$  tags at BESIII with assumptions about U-spin breaking parameters ( $\hat{\rho}$ )
- Measuring will reduce systematic uncertainties on measurements of the CKM angle  $\gamma$

$$\begin{aligned}
 & A(D^0 \rightarrow K_L^0 (\pi\pi)_{k_{CP}}) \\
 = & \frac{1}{\sqrt{2}} A(D^0 \rightarrow \bar{K}^0 (\pi\pi)) (1 - \hat{\rho}_{k_{CP}} \tan^2 \theta_C)
 \end{aligned}$$

CF  $D^0 \rightarrow \bar{K}^0 \pi^+ \pi^-$  (left) and DCS  $D^0 \rightarrow K^0 \pi^+ \pi^-$  (right) decay diagrams.

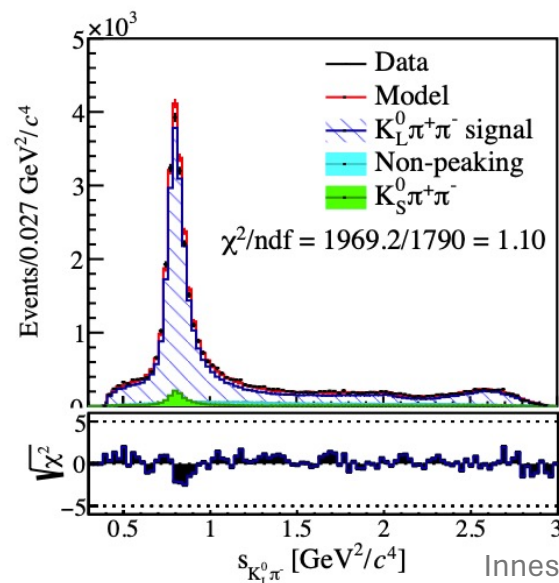

# Measurement of U-spin breaking parameters in $D^0 \rightarrow K_L^0 \pi^+ \pi^-$

- $D^0 \rightarrow K_L^0 \pi^+ \pi^-$  amplitude analysis performed (first with a  $K_L^0$ ) constraining to well-studied  $D^0 \rightarrow K_S^0 \pi^+ \pi^-$  mode assuming

$$A(D^0 \rightarrow K_L^0 (\pi\pi)_{K_{CP}}) = A(D^0 \rightarrow K_S^0 (\pi\pi)_{K_{CP}}) (1 - 2\hat{\rho}_{K_{CP}} \tan^2 \theta_C)$$

- Significant deviations from 1 show U-spin symmetry breaking

Resonance	$ \hat{\rho} $
$\rho(770)$	$1.93 \pm 0.27 \pm 0.42$
$\omega(782)$	$6.13 \pm 0.75 \pm 0.53$
$f_2(1270)$	$3.75 \pm 0.90 \pm 0.81$
$\rho(1450)$	$12.12 \pm 2.92 \pm 1.88$
$\pi\pi$ S-wave	$0.37 \pm 0.21 \pm 0.37$

Innes Mackay, BEACH 2024

Measured strong-phase differences agree with assumptions in  $K_S^0 \pi^+ \pi^-$  analysis - but now with justified errors

# Summary

- BESIII is an excellent laboratory for charm physics – clean reconstruction and quantum correlations
- Exciting new measurements in amplitude analyses, leptonic, flavour physics
- Much more to come with the collaboration having recently finished collection of  $\sim 20\text{fb}^{-1}$  data at  $E_{\text{CM}}=3.773\text{ GeV}$  ( $\sim 7\text{x}$  larger)
