

Cheated Track Multiplicity with PicoRun 4.1 CAFs

Richie Diurba for the Track Mult. Group

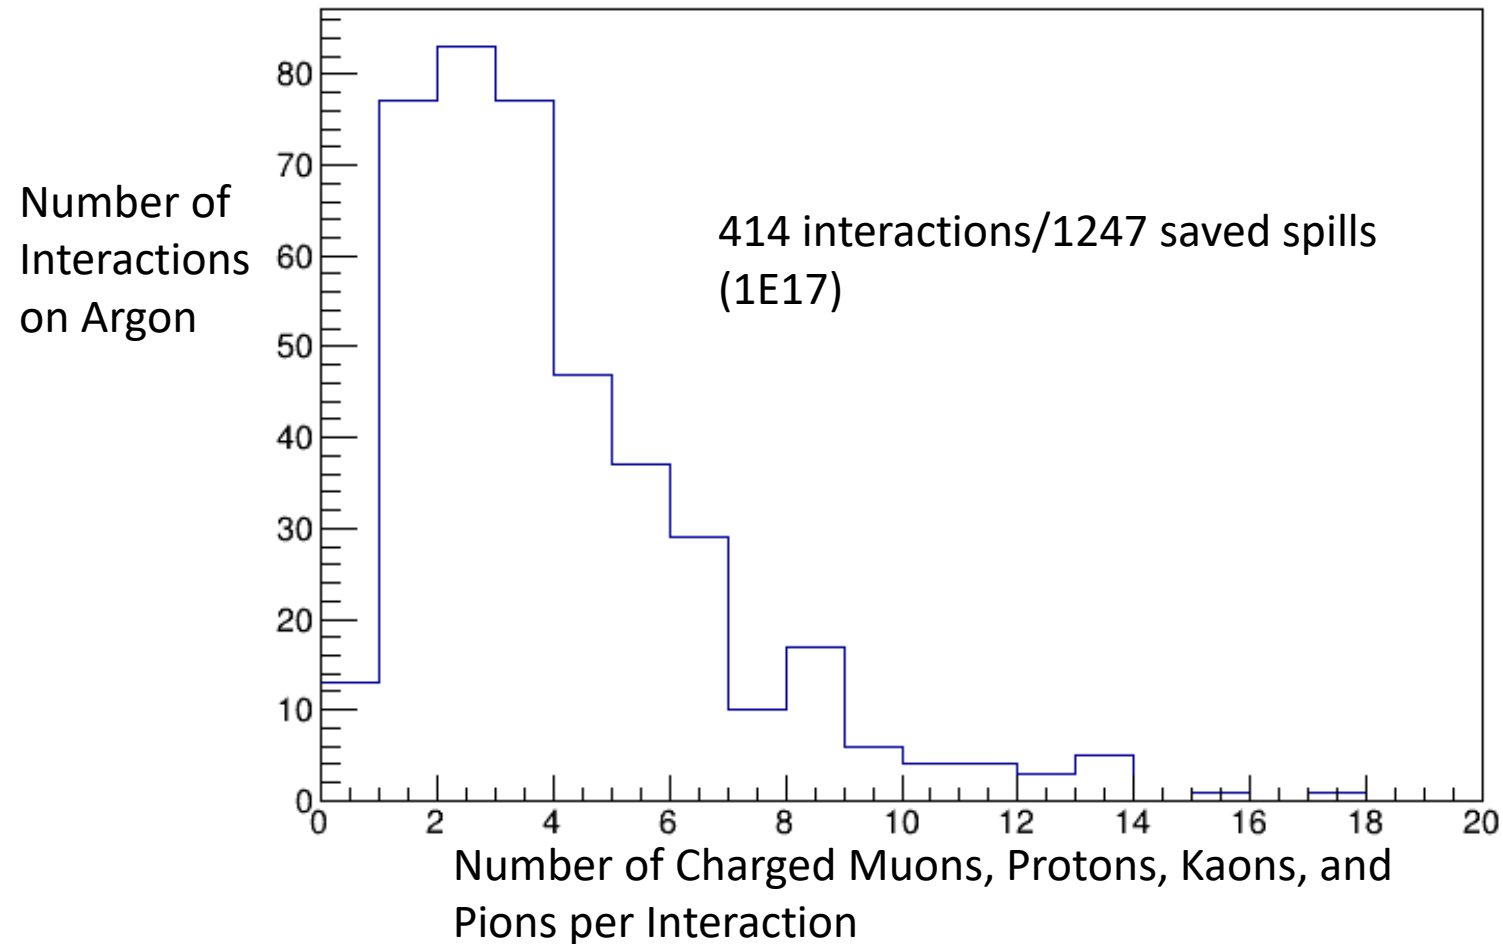

Goals for Presentation

- Show distributions for PicoRun 4.1 with a cheated event selection using GENIE info.
 - Thank you to the CAF team for producing these files!
- Purity using GENIE info still to be explored, previously used G4 interaction info stored in MLReco h5 files which may be different.

Nominal Distribution using GENIE out-of-the-box:

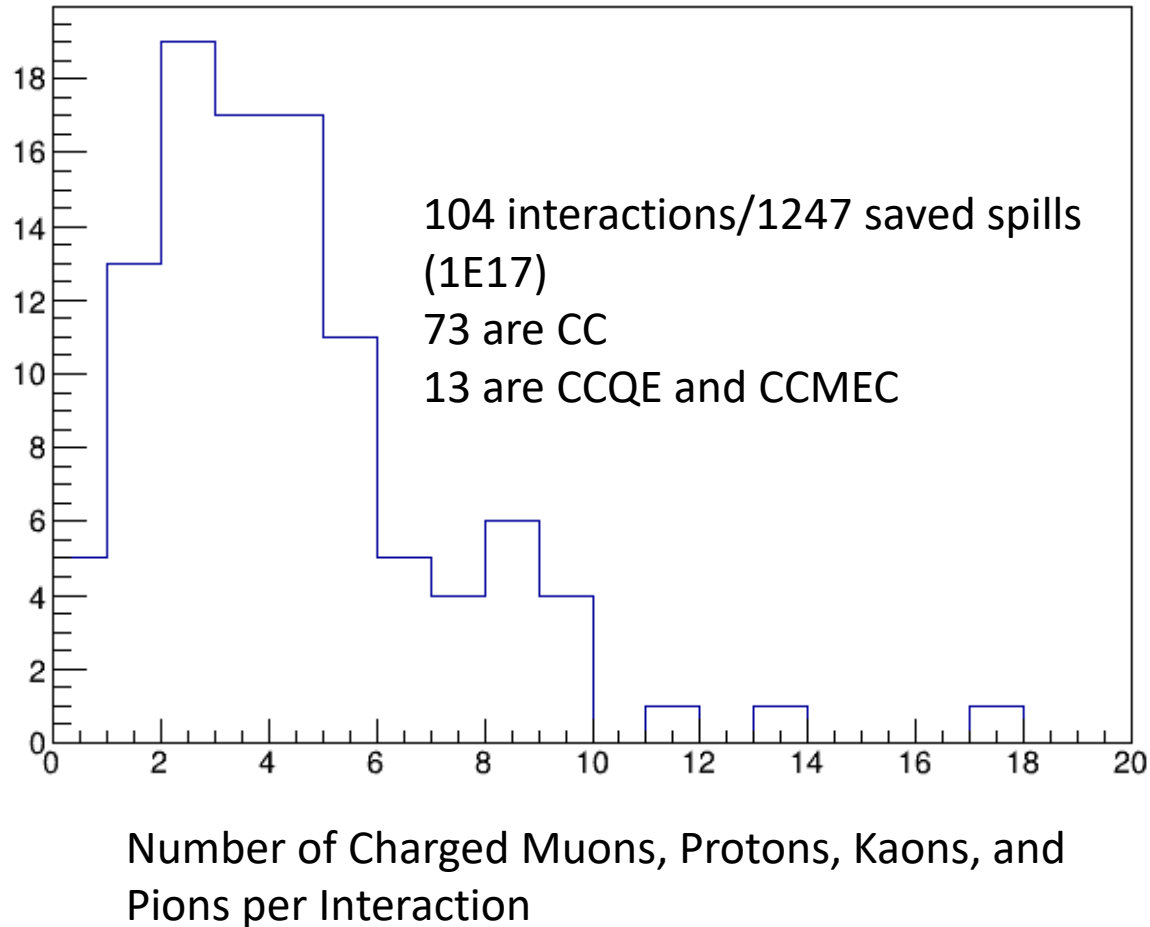

Nominal GENIE Truth Distribution with CAFs

Nominal GENIE Truth Distribution with CAFs

Let's add the fiducial volume to avoid dead space: $10 < \text{abs}(z-1300) < 50$ and $10 < x < 50$ cm

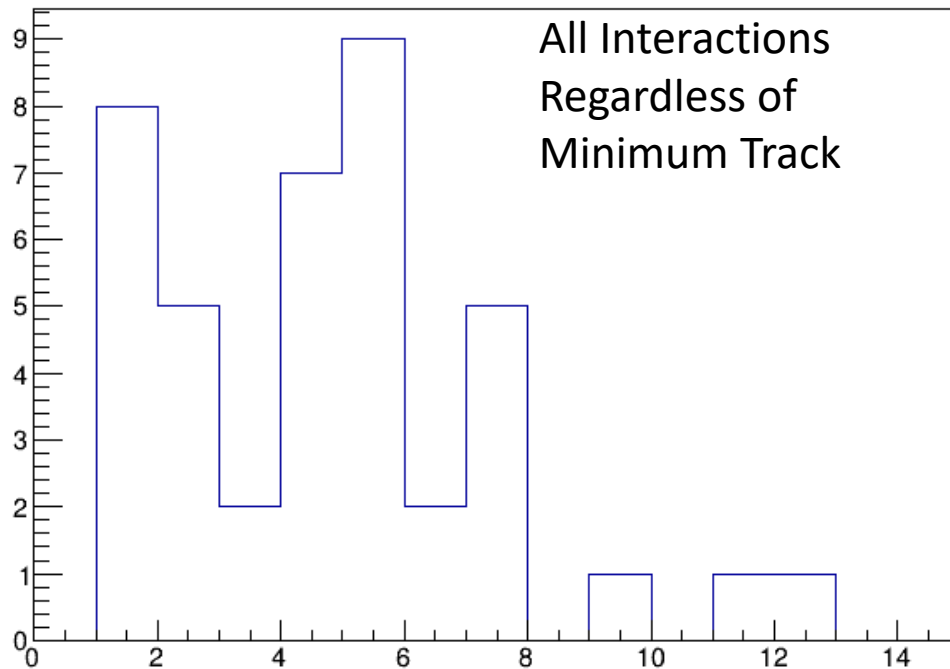

Number of Interactions on Argon

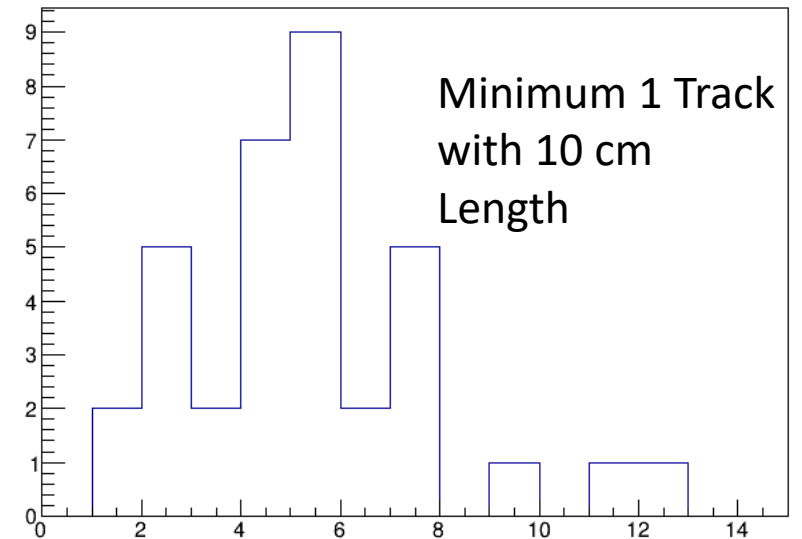

Cheated Event Selection

Check for DLP MLReco interaction vertex within 5 cm of the GENIE vertex in all Cartesian directions:

- 41 interactions found with a track > 0 cm (efficiency of around 40% for all interactions)

Number of Total Tracks in the Interaction (Are they all primary?
That variable is not available for dlp.tracks, could it be added?)

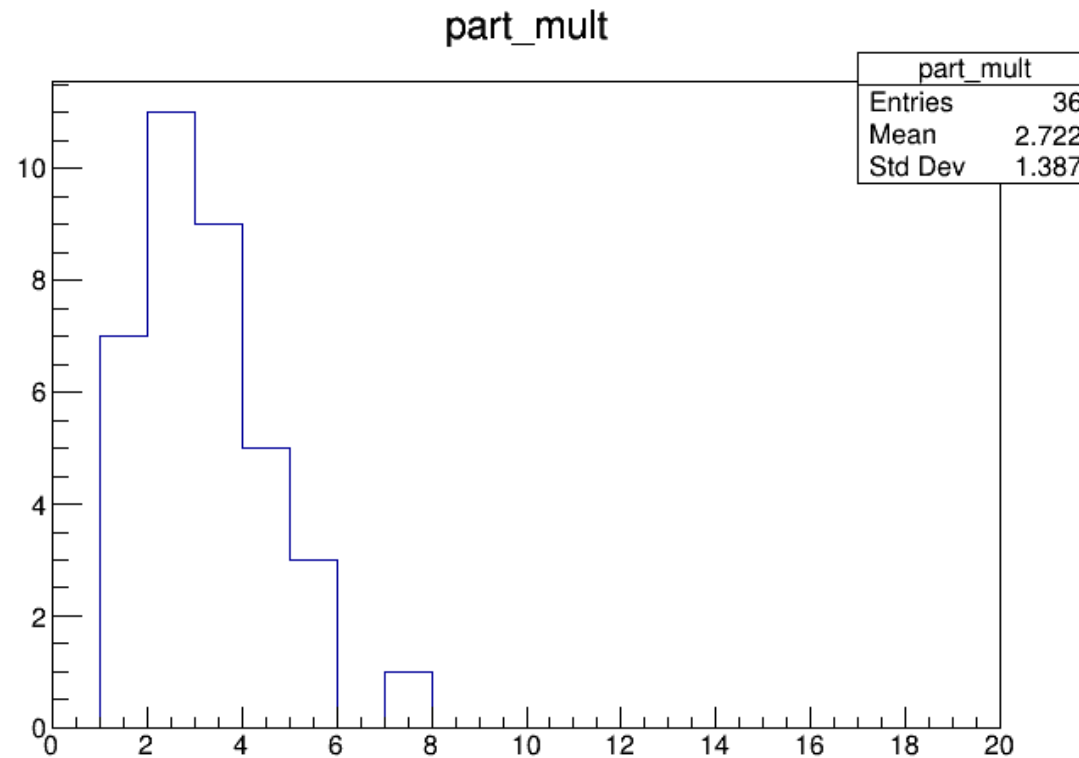

Cheated Event Selection using Particle Product

DLP Particles do have the “Primary” flag so we can investigate there:

- 36 interactions found with 1 primary track (efficiency of around 40% for all interactions)

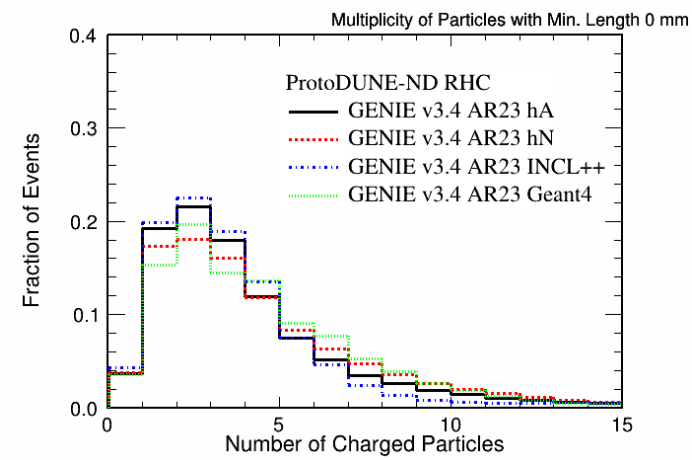

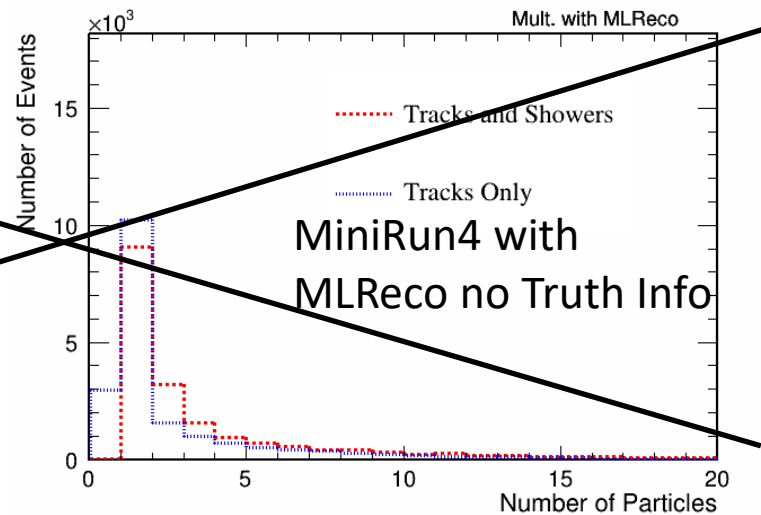

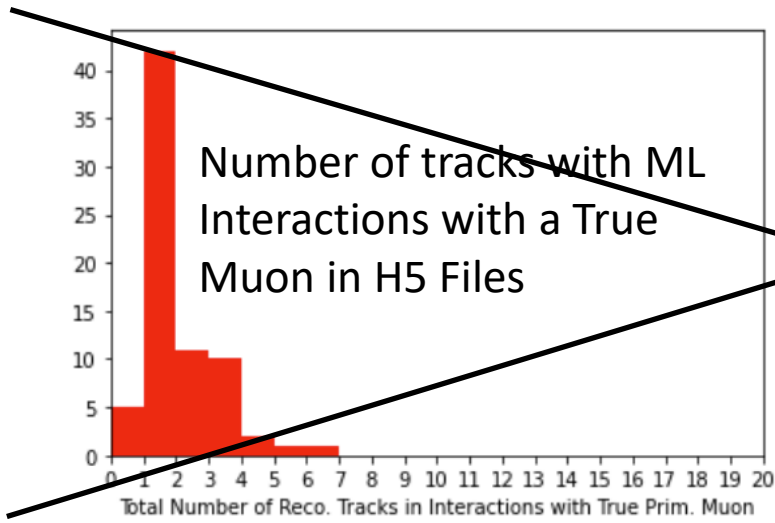

All Interactions with a Primary Track (pi+/-, p, mu, K+/-)

Number of Total Primary Tracks in the Interaction

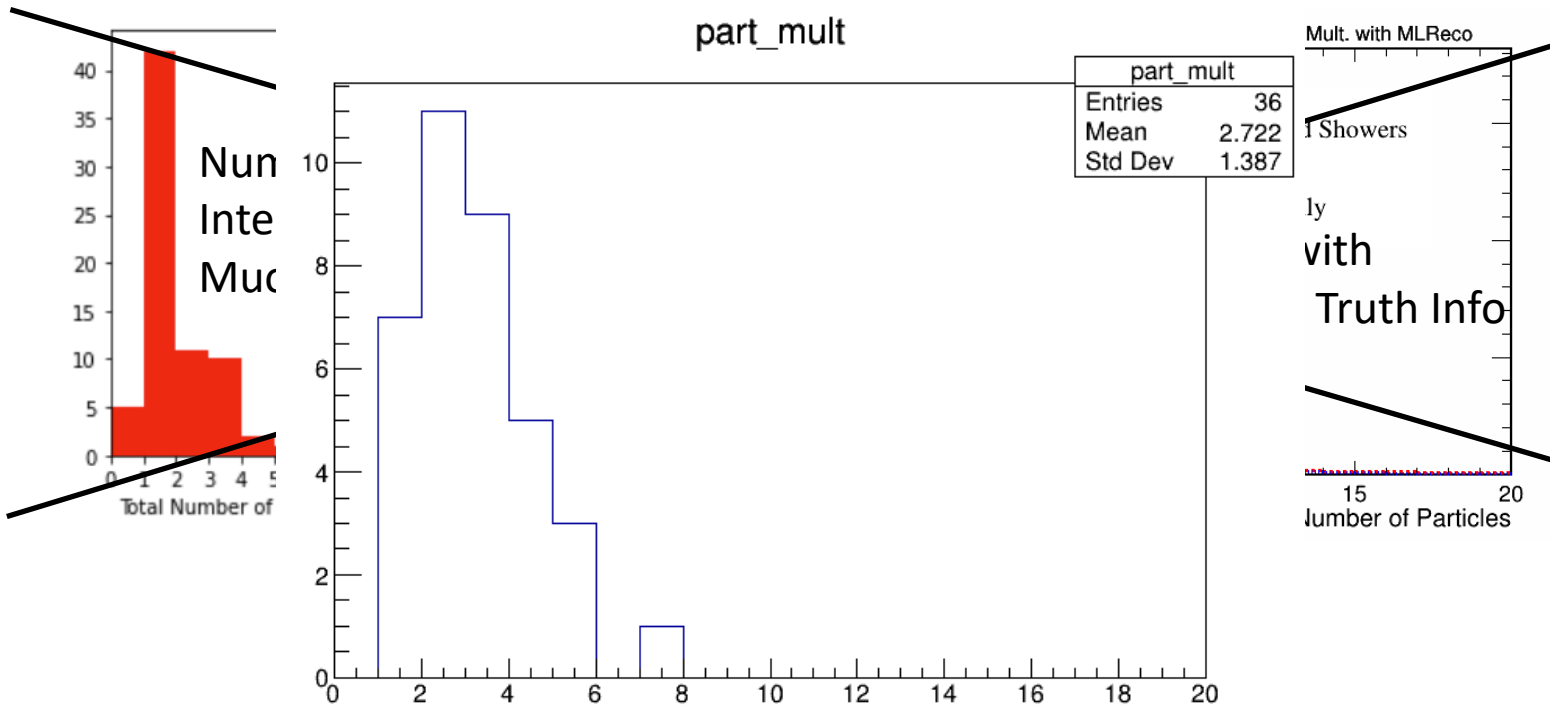

Conclusion

A long-standing issue in the H5 files has been defeated:

Conclusion

A long-standing issue in the H5 files has been defeated:

Cheated events show that MLReco matches expectation from GENIE.

Next step is optimizing the purity and figuring out the corrects cuts.

Instructions:

Used the hard work of Sindhu and Jeremy, specifically uses Sindhu's tutorial and code:

Files live here: /dune/app/users/rdiurba/cafCheatedTutorial

```
source setup.sh
```

```
source compile_cheated.sh
```

```
./cheated_plotter PicoRun41CAF.txt test.root
```

That's it!
