Machine Learning Applications using NuMI Muon Monitor Data at Fermilab

Athula Wickremasinghe Topical Meeting Feb 15, 2024

Outline

1. Motivation

- 2. Introduction to the muon monitors
- 3. Responses of Muon Monitors to the beam parameters
- 4. Machine Learning Applications

Motivation

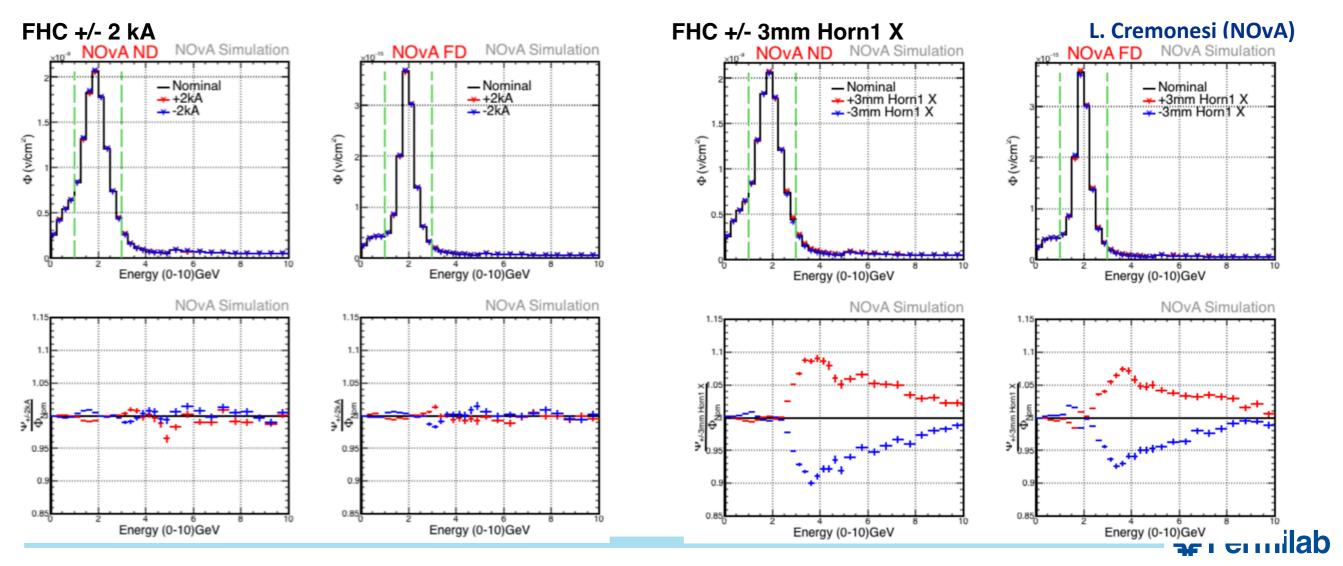

Our goal is to improve and monitor the performance of delivering the neutrino beam for experiments by applying modern machine learning techniques.

Al helps to:

- » detect anomalies and developing trends such as target tilt/ slip, density effects, horn tilt or slip, etc
- » understand the physics tolerances in the real time operations
- » make life easy for operators with ML predictions

Physics Tolerances for Neutrino Flux Predictions

- Physics tolerances: the acceptable limitations of possible upstream variables that have an effect on neutrino data quality
- Theses tolerances are set according to the simulation studies
- Flux systematic uncertainties are calculated according to the tolerances
- Any target change effects on neutrino measurements
- Changes on horn magnetic field has a significant impact on the neutrino beam

Physics Tolerances for Neutrino Flux Predictions

Physics tolerance in NOvA

- Horn Current ±2 kA
- Horn1 position shifted by ±3 mm in X and Y separately
- Horn2 position shifted by ±3 mm in X and Y separately
- Beam position on the target shifted by ±1 mm in X and Y separately
- Beam spot size nominal ±0.2 mm both in X and Y
- Horn water layer ±1 mm
- Target position shifted in z by ±7 mm
- 54 µrad beam divergence

External detector like muon monitor can be used to build AI models to quantify these physics tolerances more precisely with real time beam operations

Quantity	1-sigma Shift	Notes	In TDR	
Horn A Transverse Displacement	0.5 mm	X and Y shifted separately,	Y	
		added in quadrature		
Horn A Transverse Tilt	0.5 mm	X and Y shifted separately,	N	
		added in quadrature; upstream		
		and downstream ends shifted in		
		different directions		
Horn B Transverse Displacement	0.5 mm	X and Y shifted separately,	Y	
		added in quadrature		
Horn B Transverse Tilt	0.5 mm	X and Y shifted separately,	N	
		added in quadrature, upstream		
		and downstream ends shifted in		
		different directions		
Horn C Transverse Displacement	0.5 mm	X and Y shifted separately,	N	
		added in quadrature		
Horn C Transverse Tilt	0.5 mm	X and X shifted separately,	N	
		added in quadrature; upstream		
		and down stream ends shifted in		
		there it directions		
Target Transverse Displacement	0.5 mm	X and Y shifted separately,	N	
Target Handterbe Displacement		added in quadrature		
Target Transverse Tilt	0.5 mm		N	
Target Handverbe The		Sadded in quadrature: unstream		
		and downstream ends shifted in		
	2 mgr	different directions		
Horn A Longitudinal Displacement			N	
Horn B Longitudinal Displacement			N	
Horn C Longitudinal Displacement			N	
Proton Beam Transverse Position		V and V shifted comparately	Y	
Proton Beam Transverse Position	0.5 mm	X and Y shifted separately;	I	
Proton Room Radius	10%	added in quadrature	v	
Proton Beam Radius	10%	Updated from 0.1 mm for NuMI	Y	
Proton angle on target	70μ rad	X and Y shifted separately;	Y	
	0.1	added in quadrature	v	
Decay Pipe Radius	0.1 m		Y	
Horn Currents V	1%	Changed in all three horns	Y	
	0.050	simultaneously		
Baffle Scraping	0.25%	To Be Updated	N	
Bafflet Scraping	0.25%	To Be Updated	N	
Target Density	2%	~	Y	
Horn Water Layer Thickness	0.5 mm	Changed in all three horns	Y	
		simultaneously		
Upstream Target Degradation			N	
# Protons on Target	2%		Y	
Near Detector Position			N	
Far Detector Position			N	
Field in Horn Necks			N	
Decay Pipe Position	20 mm		N	

Table 1: Sources of alignment and focusing uncertainties in the neutrino fluxes at DUNE. Sources that were considered in physics studies in the TDR are marked with a 'Y' in the 'In TDR' column.

Introduction to Muon Monitors

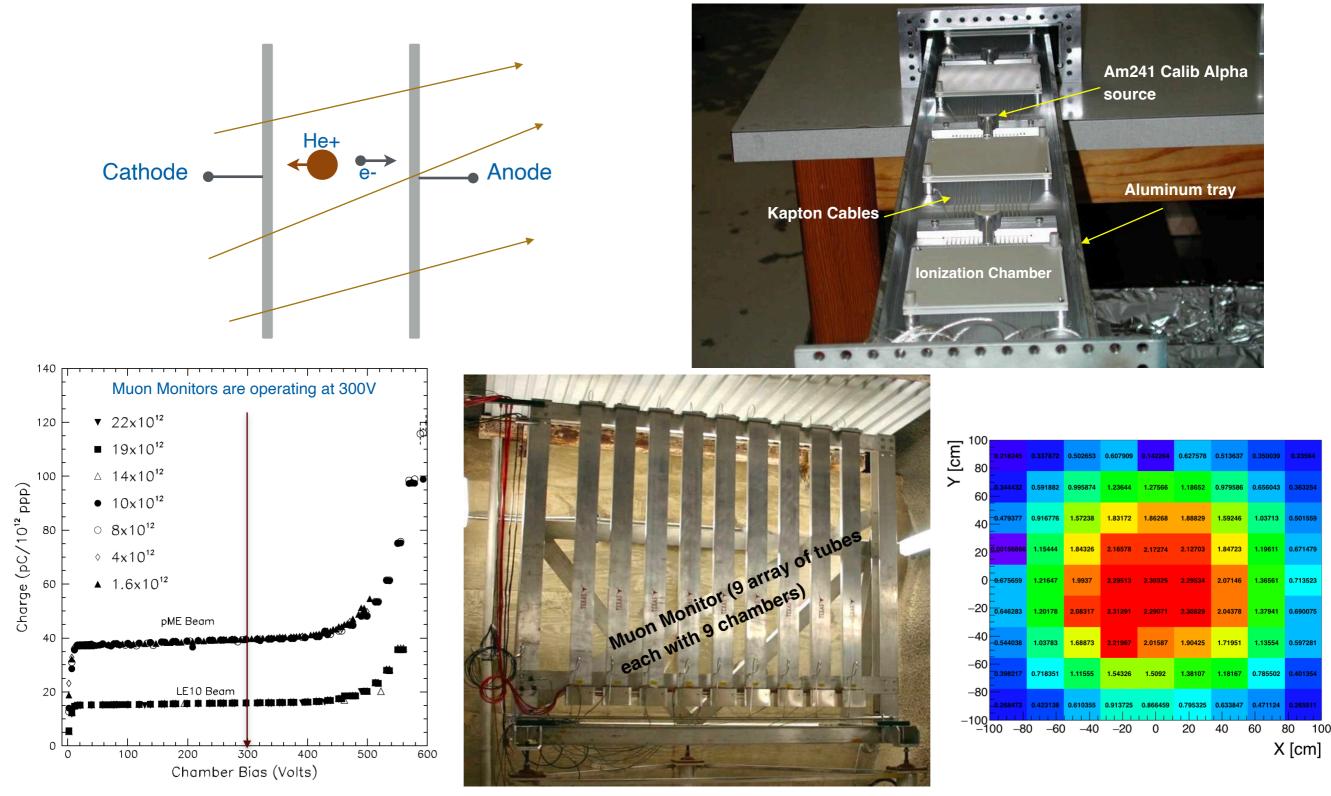

- Three muon monitors are located in the downstream of the hadron absorber
- Each muon monitor consist of 9x9 arrays of ionization chambers
- Each ionization chamber consists of two ceramic parallel plates with the separation of 3 mm gap
- The chambers are filled with He gas

Introduction to Muon Monitors

• Operational voltage has been selected to minimize the recombination effects and to avoid the signal issues with the proportional region

Pixels Responses

- Each muon monitor sensitive to different hadron momentum thresholds
- Focusing of muon flux at the monitors is unique
- Unique responses of individual pixels to the upstream beam, target and horn focusing changes

- 3. Responses of Muon Monitors to the beam and the horn current
- 4. Machine Learning Applications
 - Predicting Beam Parameters
 - Identifying incidents / anomalies

Predicting Beam Parameters

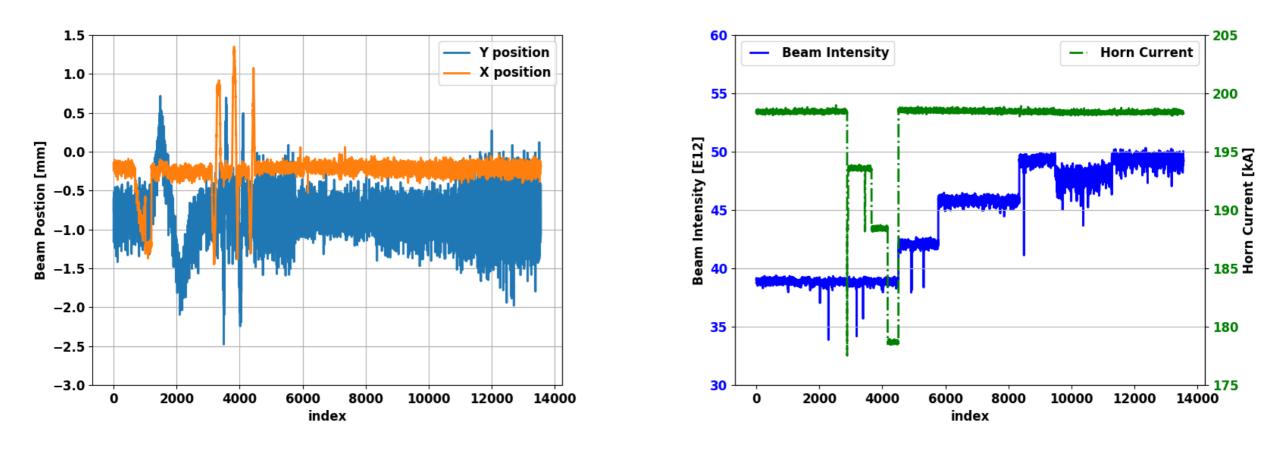

MOTIVATION: Building a model to predict upstream beam variables by using downstream muon monitor data.

A Model to Predict Beam Variables and Horn Current

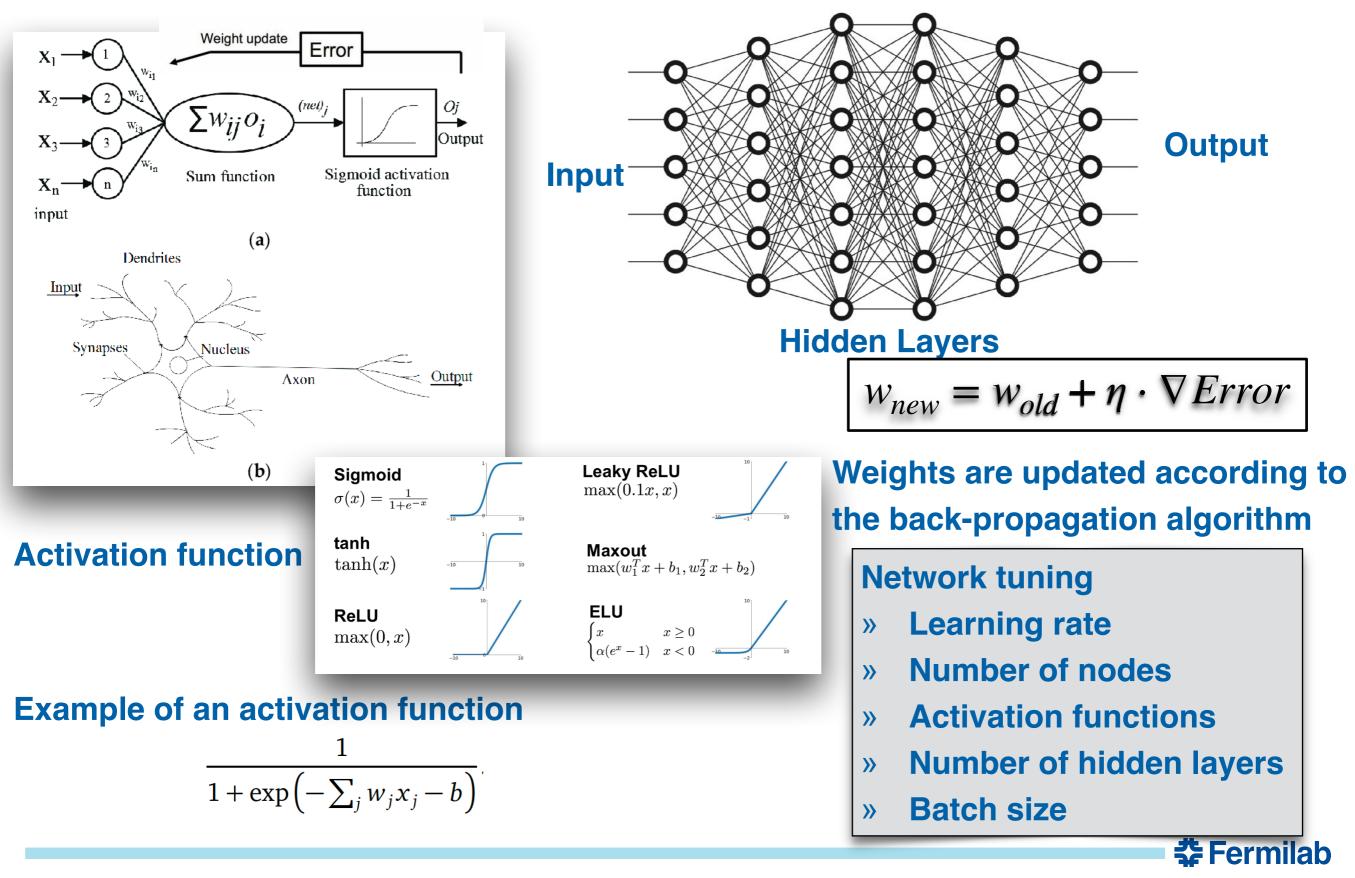

Data Preparation:

- » The data samples have been collected from the spill-by-spill time series measurements
- » The randomly sampled training (70%) and validation (30%) data samples were selected from the target scans and normal operations
- » A neural network has been trained by taking account 241 pixels as inputs

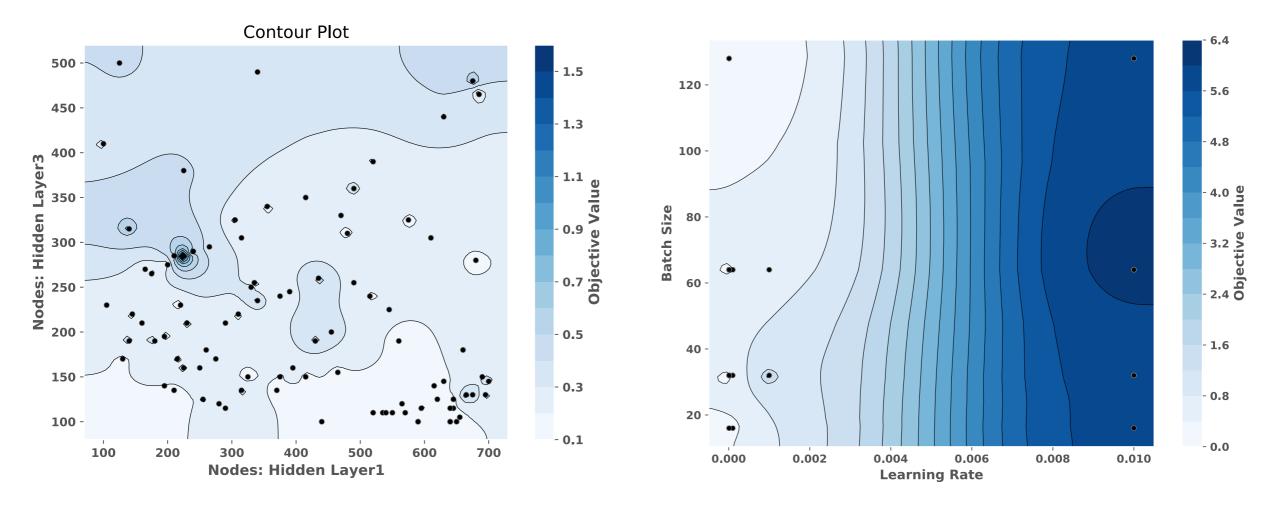

Neural Network Architecture

Hyperparameter Tuning

The process of searching for the best model architecture is referred to as hyperparameter tuning.

- » Tuning the model based on Bayesian Optimization Algorithm.
- » Searching the optimal parameters minimizing the standard error on predictions.

Optimized Model Architecture

An example of optimized ANN architecture:

Input pixels = 241(removed 2 bad pixels)

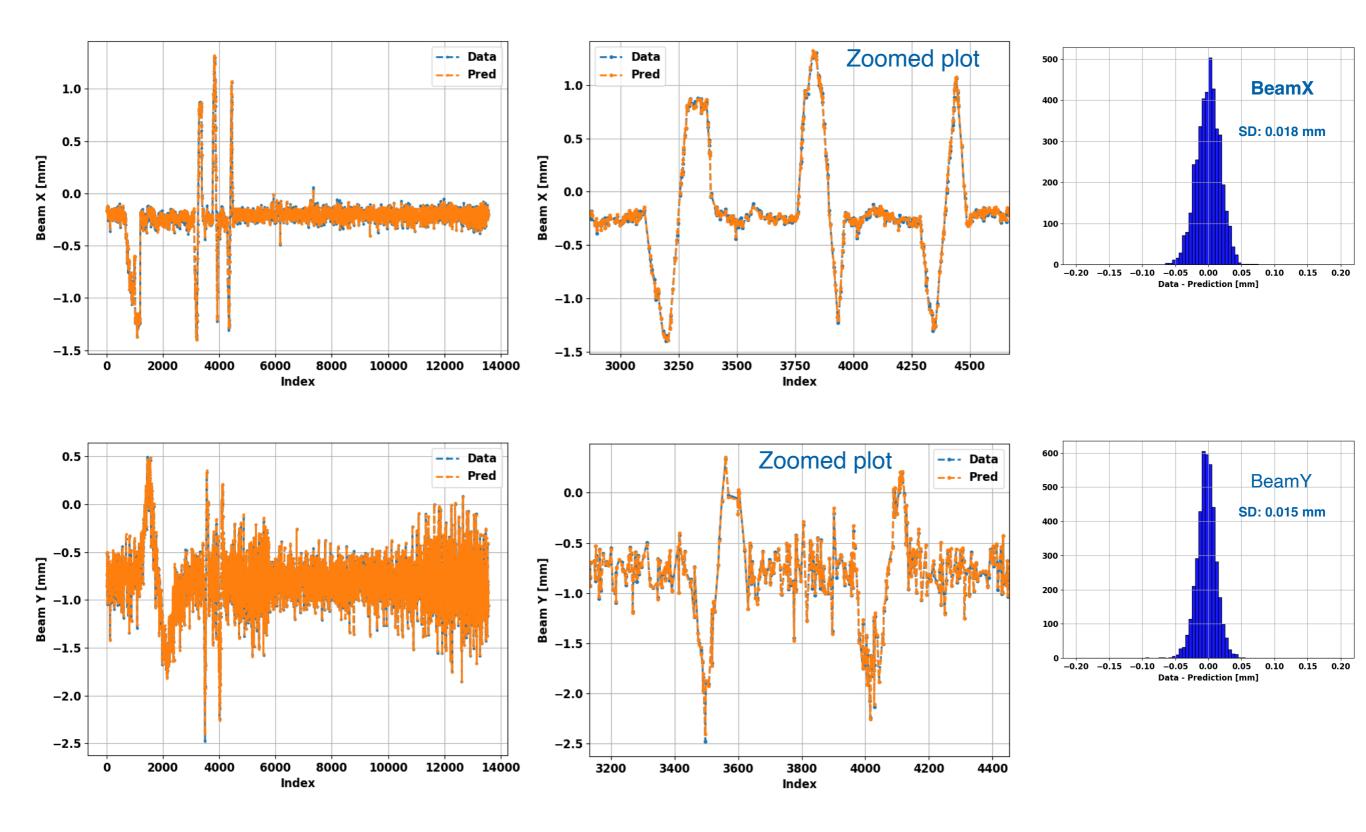

Batch size = 32

Learning rate = 1E-5

Layer (type)	Output Shape	Param #	Activation
dense (Dense)	(None, 480)	116160	Tanh
dense_1 (Dense)	(None, 130)	62530	Sigmoid
dense_2 (Dense)	(None, 135)	17685	Sigmoid
dense_3 (Dense)	(None, 11)	1496	Sigmoid
dense_4 (Dense)	(None, 4)	48	Linear

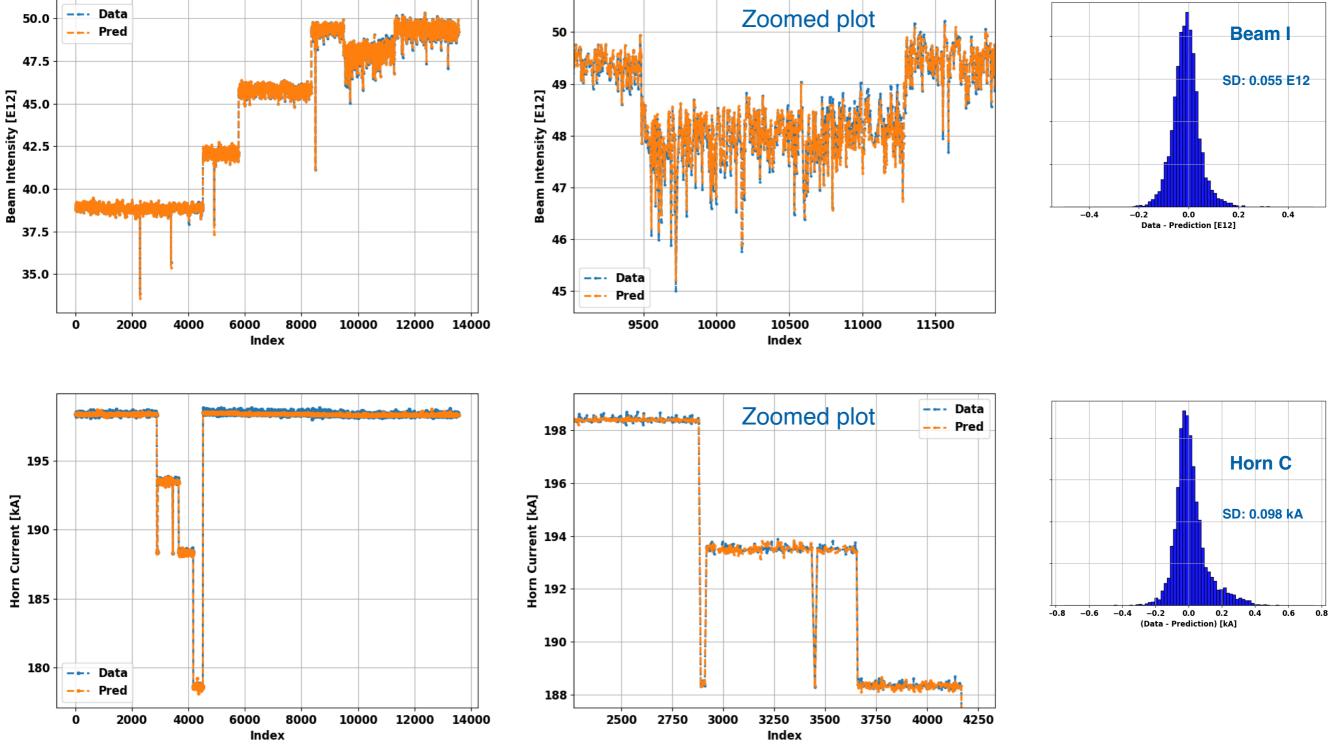

Predicting Proton Beam Positions

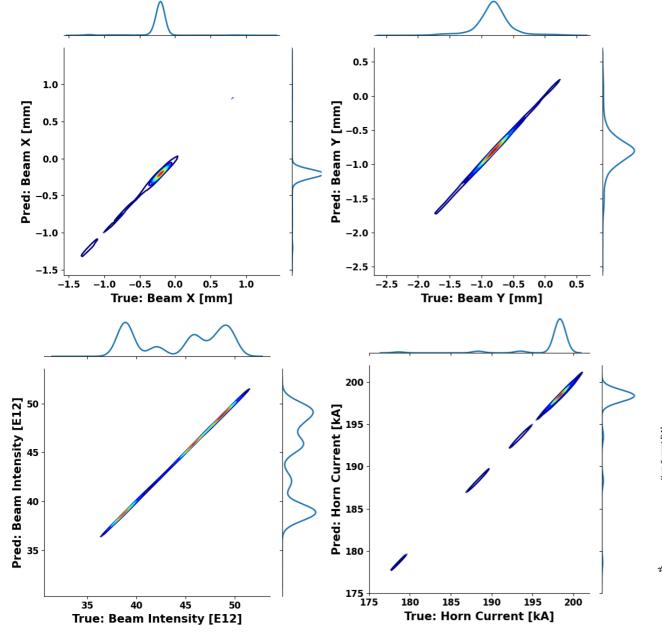

Predicting Beam Intensity and Horn Current

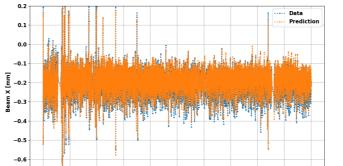

Validating and Testing

The model validation and performance testing have been done by using randomly selected validation sample.

Testing with normal operation data :

- The model has been tested with randomly selected data sets for the normal beam operations
- The predictions are promising to use the model as a monitoring tool for the normal operations in the future

ML Predictions to Find Upstream Data Quality

Example of finding a BPM signal issue with ML predictions

From Katsuya

🛟 Fermilab

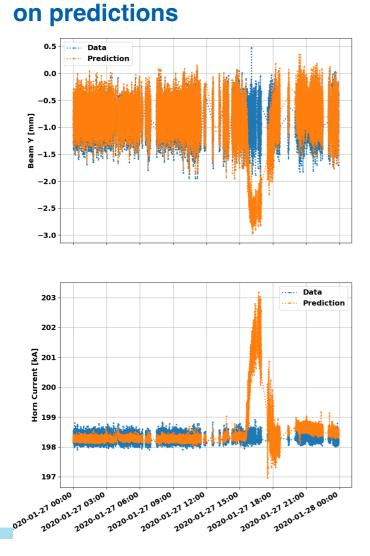

Concerns

ML models depend on:

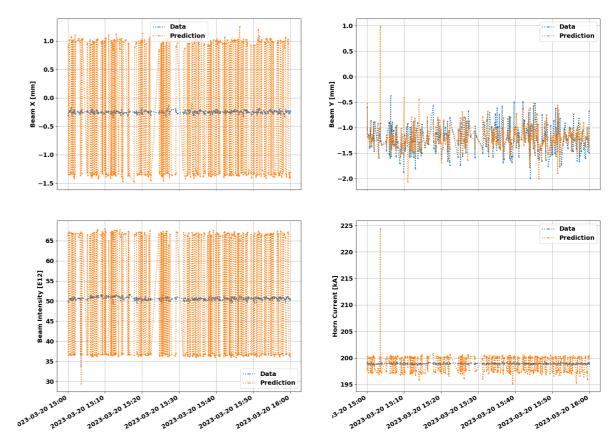

- * the data quality of the training samples,
- * the special data samples like beam scan data.
- ML predictions with normal operations depends on:
- * muon monitor signal quality,

Example of He gas quality effecting

* beamline changes such as the target, horn focusing, etc.

Predictions on 2023 data from 2022 ML model

Can't use the same model after doing any beam line changes

Remarks

- Every single changes on the beam parameters are sensitive to the muon monitor signal
- Demonstrated the capability of separating the correlations of beam variable changes to the muon flux.
- Muon monitor signals can be used as an independent monitoring system to understand the beam performance.
- ML applications can be helpful to monitor the beam quality, issues and anomalies.
