

# WIBEth to DAQ Communications and Configuration Generation

Ron Rechenmacher

ICEBERG Commissioning and Operation Meeting

7 February 2024

# WIBEth to DAQ Communications and Configuration Generation

- WIBEth to DAQ Communications
  - Network interface for “CCM” (1Gb)
    - ssh server (TCP)
    - UDP
  - Network interfaces for data (2x10Gb)
    - UDP
- Configuration Generation
  - Input .json files
  - Scripts for generating “DAQ usable” WIB data flow and DAQ configuration directories

# UDP data flow

- WIBEth data interfaces connect to network switch
- Switch can be configured to mirror data in on one port to be sent out on another
  - Switch “activity” lights are useful
- Standard linux tcpdump can be used to examine UDP packet details

# Basic instructions for taking data

- [https://wiki.dunescience.org/wiki/Taking\\_data\\_at\\_ICEBERG](https://wiki.dunescience.org/wiki/Taking_data_at_ICEBERG)
  - Environment setup – directory to cd to; file to source; cd runarea
  - Configure – wibs, (WIBEths, daq)
  - Simple test – check data flow
  - Nominal Data Taking Script
- Not operations
  - no - Log book
  - no - Run description
  - no - Online DQM
  - no - Spreadsheet of run/output file description/details
  - ???

# The **runarea** directory

- Directories in the **runarea**:
  - confgen – contains the configuration scripts and **input** configuration source
  - confs - the **output** from confgen – input to runs
  - RunConfs – record of conf from the run (has run #)
  
  - logs – logs for various daq components during a run

# Input json config files

- Change contain a small portion of the total config
  - Generation programs will initial unspecified parameters to defaults
- Input to generate\_\*.sh scripts
  - cpupin-iceberg.json
  - iceberg\_daq\_eth.json
  - iceberg\_dromap\_\*.json
  - iceberg\_hermes.json
- Input to recreate\_wib\_configuration.sh
  - iceberg\_wib.json

# iceberg\_wib.json

```
"wibmod":{

```

# Config scripts confgen/generate\_\*.sh

- generate\_wib10\*.sh scripts
  - hermesmodules\_gen
    - Output config for WIBEth boards (UDP)
      - boot.json
        - Params to starting Hermes daq\_application on the WIBEth
      - init.json (data/hermes\_init.json)
        - Make a connection
      - conf.json (data/Hermes\_conf.json)
        - **UDP parameters**

# Config scripts confgen/generate\*.sh (continued)

- fddaqconf\_gen (receive (dpdk) and write to disk)
  - Output config
    - boot.json
      - Apps { 1.dataflow, 2.dfo, 3.fakehsi(HardwareSignalsInterface), 4.ruiceberg03eth0, 5. trigger }
      - Thread pinning
      - Etc (dpdk)
    - init.json
      - connections
    - dromap.json
      - det\_id, crate\_id, slot\_id, stream\_id
    - conf.json
      - All kinds of params for each daq app

# Config script confgen/recreate\_wib\_configuration.sh

- wibconf\_gen
  - Output config
    - boot.json
      - Daq\_application\_ssh (looks like Hermes)
    - init.json
      - connection
    - conf.json
      - Wib parameters

## confs config out directories – actual

```
/home/dunecet/dunedaq/fddaq-v4.2.1-a9/runarea  
(dbt) dunecet@iceberg03 $ ls -d confs/iceberg_*  
drwxr-x--- 4 dunecet 128 Feb  7 00:26 confs/iceberg_daq_conf/  
drwxr-x--- 4 dunecet 113 Feb  7 00:26 confs/iceberg_hermes_conf/  
drwxr-x--- 3 dunecet  93 Feb  6 19:19 confs/iceberg_wib_conf/  
--2024-02-07_00:31:32_CST--
```

Daq nanorc reads from these directories at the beginning of a run.

# Times

- Config
  - Recreate\_wib\_configuration..
    - 0m2.614s
  - Daq and Hermes config
    - 0m6.819s
- 60 second run...
  - time ./nanorc\_run.sh
    - 2m30-ish to 3m30-ish (Currently small data runs, but data written to NFS!!!)

# Log files

- Log files are put in the **logs** directory with the date included in the file name

```
-rw-r----- 1 dunecet 201K Feb  6 16:48 log_2024-02-06_164625_ruiceberg03eth0_3436.txt

```

# Recap – WIBEth to DAQ Communications and Configuration Generation

- WIBEth to DAQ Communications
  - Network interface for “CCM” (1Gb)
    - ssh server (TCP) – start servers
    - UDP server
  - Network interfaces for data (2x10Gb)
    - UDP WIB data
- Configuration Generation
  - Input .json files – can be hand or machine edited
  - Scripts for generating “DAQ usable” WIB data flow and DAQ configuration directories
    - Nanorc daq runs will read from these directories

# Issues and What's Next

- Issues:
  - Run number – not using a “run number service”
  - Since, currently, ssh is used as a part of data taking, one can get “permission denied” errors if/when your kerberos ticket expires.
    - I’ll soon add a check for expired ticket
  - Currently, the configure scripts need to be run only from the runarea directory
  - Scripts and input config files need to be added to some repo
    - In case they’re accidentally deleted or messed up.
  - Data written to NFS
- What's Next
  - Shekhar talked about automated runs that explore the parameter space.
