

Hadron Production Measurements with EMPHATIC

Thursday, 19 September 2024 14:25 (20 minutes)

EMPHATIC (Experiment to Measure the Production of Hadrons At a Test beam In Chicagoland) is a table-top size experiment at Fermilab focused on hadron production measurements relevant to reducing the total neutrino flux uncertainties at accelerator-based neutrino experiments. The goals of the experiment include addressing the gaps in our understanding of hadron-scattering and the first-ever measurement of the hadron spectrum downstream of a neutrino beam target and horn. Recent progress from EMPHATIC will be discussed, including a first proof-of-principle measurement and collection of a large catalog of thin-target data. Plans for EMPHATIC over the next few years, including measurements with a replica NuMI target and horn will also be presented.

Working Group

WG 3: Accelerator Physics

Primary authors: FIELDS, Laura (University of Notre Dame); CHIRCO, Robert (Illinois Institute of Technology)

Presenter: CHIRCO, Robert (Illinois Institute of Technology)

Session Classification: Parallel: WG 1x3

Track Classification: WG3: Accelerator Physics
