SAND ECAL WG Meeting – 18th March 2024

Choice of FEE for SAND/ECAL

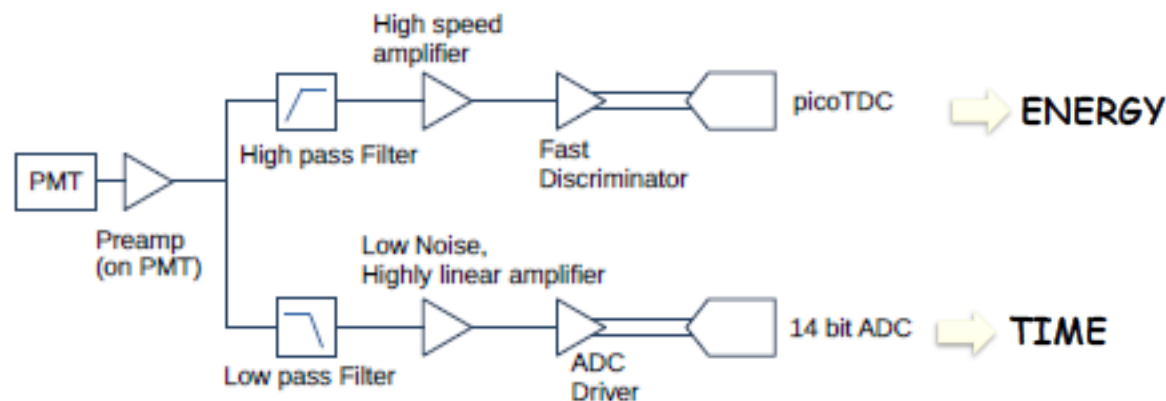

Three possible read-out schemes:

*Highest Flexibility =>
Fsampl ~ 1 GS/s =>High
Cost or Fsampl ~ 125-250
MS/s + signal shaper*

*Less Flexibility => energy by
ToT with 2 or more
thresholds not to worsen
energy resol. Time walk
correction needed*

less Flexibility

Pico TDC test

Test setup:

1.

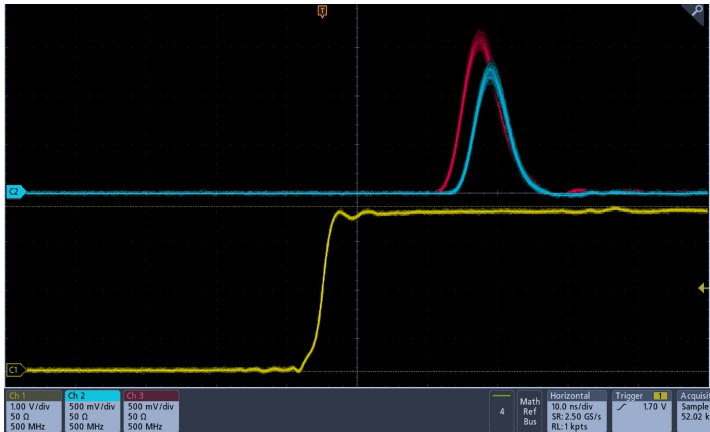

PMT's signal
LED Driver with fixed
amplitude

Step
Attenuator

DT5203+A5256

- PMT WA5656
- PMT WA8792
- Start on Ch0 with trigger from LED Driver. Stop on Ch1 and Ch2 (dual threshold) with variable amplitude.
- **Sweep**: acquire **ToT** and ΔT at different amplitudes (from 0 to 52 dB)
- Fit points and build **ToT-Walk** and **ToT-Ampl** curves
- Use curves to correct Walk from ToT (replace CFD)
- Use curves to get Amplitude from ToT (make ADC from TDC)

Pico TDC test

Calibration Curve:

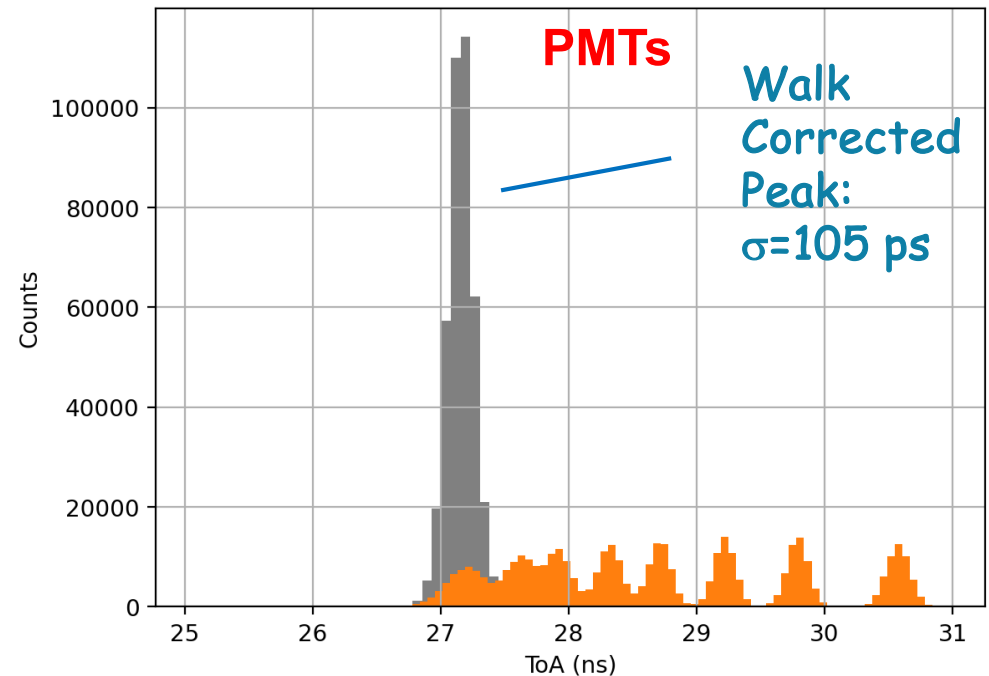

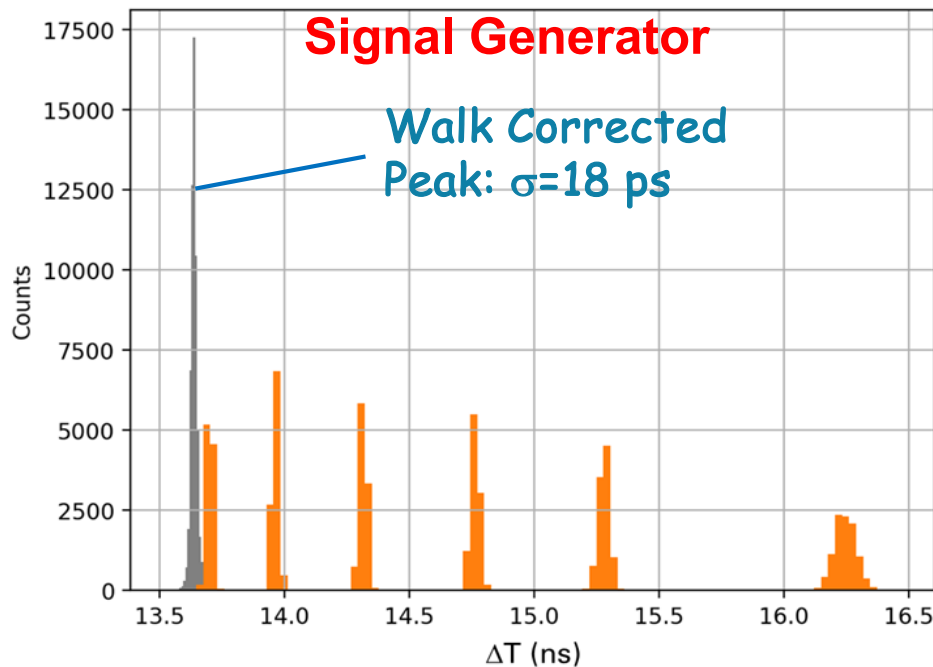

Pico TDC test

PRELIMINARY

Walk Correction and comparison with the signal generator data

- Acquired pulses at different amplitudes over a 50 dB dynamic range
- The walk causes ~ 2 ns spread on ΔT : separate peaks appear on the histogram.
- ΔT corrected by ToT using a 5th order polynomial fit of the **ToT-Walk** points)

- Corrected ΔT histogram presents one single peak:
- **18 ps RMS for the data from the signal generator**
- **105 ps RMS for the data from the PMTs**

Pico TDC test

Test setup:

2.

- PMT WA5656
- PMT WA8792
- Signal splitted:
 - i. Pico TDC
 - ii. Digitizer
- Resolution comparison
- TDC: Start on Ch0 with trigger from LED Driver. Stop on Ch1 and Ch2 (dual threshold) with variable amplitude.
- Digitizer: autotriggering on the Ch0.

Pico TDC test

Conclusions

- The time resolution with the signal generator is 18 ps RMS, while for the PMTs signal is 105 ps on a 50 dB dynamic range
- Work in progress and more tests undergoing for the amplitude resolution evaluation.
- New ideas e.g. use of a fast shaper, worth to be tested.
