ND_CAFMaker including SAND

Lea Di Noto

April, 3rd 2024

Status and planning

- CAF is a common framework for recording info from MCTruth and Reco for analysis

- The code for ND is under develpment by each ND subdetector group
  https://github.com/DUNE/ND_CAFMaker

- A first code for SAND was implemented in 2022 (in branch SAND_variables)

- The info are saved in the structured **duneanaobj**
  https://github.com/DUNE/duneanaobj/

- The code must be updated accordingly to the current version of duneanaobj

TO DO

- In this [Talk](#) by Jeremy Wolcott the major changes are described

- Our job is to modify the SANDRecoBranchFiller where the the CAF variables are filled with sand-reco data

- How many info? It depends on the analysis, but let's start..

- There will be some technical issues (for Truth-Reco association, ..)
