

## OSCURA in 10 Minutes

*Tuesday, 9 July 2024 11:30 (15 minutes)*

The Oscura experiment seeks to achieve unprecedented sensitivity in the search for low-mass dark matter particles using a  $\sim 10$  kg detector array of silicon, ultra-low noise Skipper Charge Coupled Devices (CCDs) with a detection threshold of two electrons and a total exposure of 30 kg-year. Oscura will probe sub-GeV dark matter particles that interact with electrons, targeting dark matter-electron scattering for masses down to  $\sim 500$  keV and dark matter absorption by electrons for masses down to  $\sim 1$  eV.
