

Update on muon Signed Distance

Aug. 9, 2024

TMS

Mike Dolce

TMS muon signed distance

- Sushil did great work relating to the sign distance.
- Begun looking into Sushil's code to continue it and obtain some useful metrics about muon reco capabilities.
- Seems there is some interested in:
 - low-KE muons?
 - high-KE muons?

$$\mathbf{S.D} = (\mathbf{x3} - \mathbf{x1}) - (\mathbf{x2} - \mathbf{x1})(\mathbf{z3} - \mathbf{z1})/\mathbf{z2} - \mathbf{z1}$$

$[\mathbf{x1}, \mathbf{z1}] = \mathbf{ND LAr exit}$

$[\mathbf{x2}, \mathbf{z2}] = \mathbf{TMS start}$

$[\mathbf{x3}, \mathbf{z3}] = \mathbf{TMS end}$

Inputs

- I am working off of a new branch `sign_dist_mu_mom`, off of `main` branch from ~ few days ago.
- Using an FHC and RHC `tmsreco` file (below).
 - FHC is 1 T magnetic field.
 - Unsure of the RHC file B field.

```
/exp/dune/data/users/kleykamp/tmsreco_combined_files/2024-04-19_bfield_1p0T.tmsreco.root  
/exp/dune/data/users/kleykamp/tmsreco_combined_files/2024-04-18_rhc_test_larger.tmsreco.root
```

Signed distance

- Took Sushil's code slightly further:

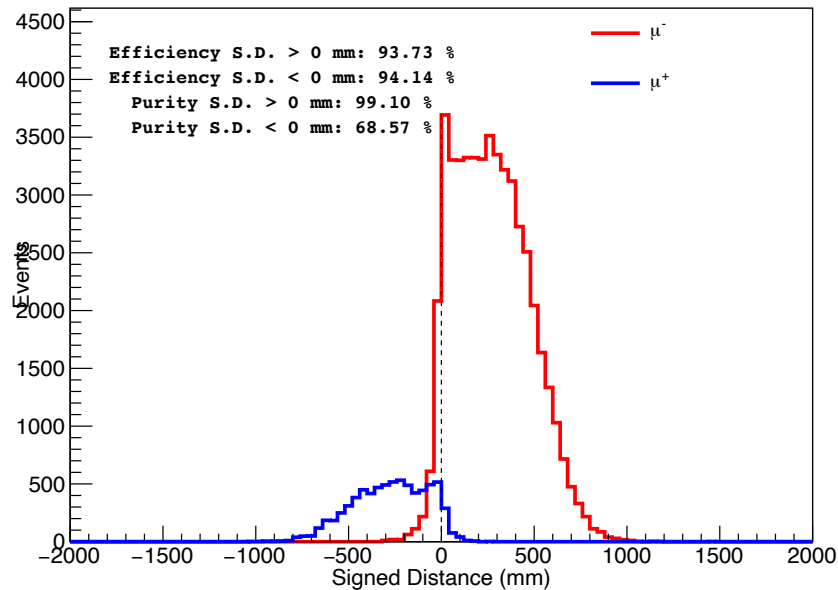

- made an attempt at an efficiency and purity metric.

$$\mathbf{S.D} = (\mathbf{x3} - \mathbf{x1}) - (\mathbf{x2} - \mathbf{x1})(\mathbf{z3} - \mathbf{z1})/\mathbf{z2} - \mathbf{z1}$$

$$\text{efficiency } \mu = \text{events of } \mathbf{SD} > 0 / \text{all } \mu \text{ events}$$

$$\text{purity } \mu = \mu \text{ events of } \mathbf{SD} > 0 / \text{all events of } \mathbf{SD} > 0$$

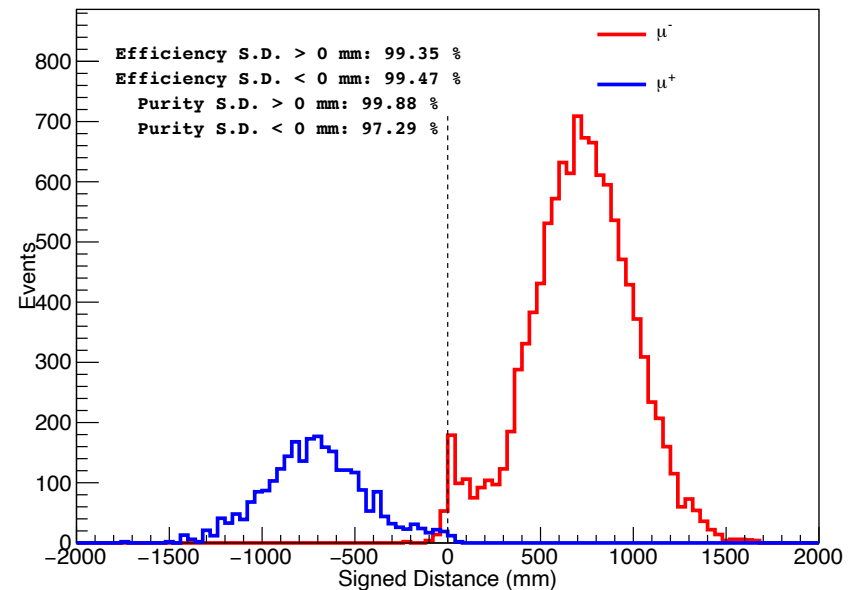

1000.0 < KE_μ < 2000.0 MeV

2000.0 < KE_μ < 3000.0 MeV

3000.0 < KE_μ < 4000.0 MeV

Signed distance

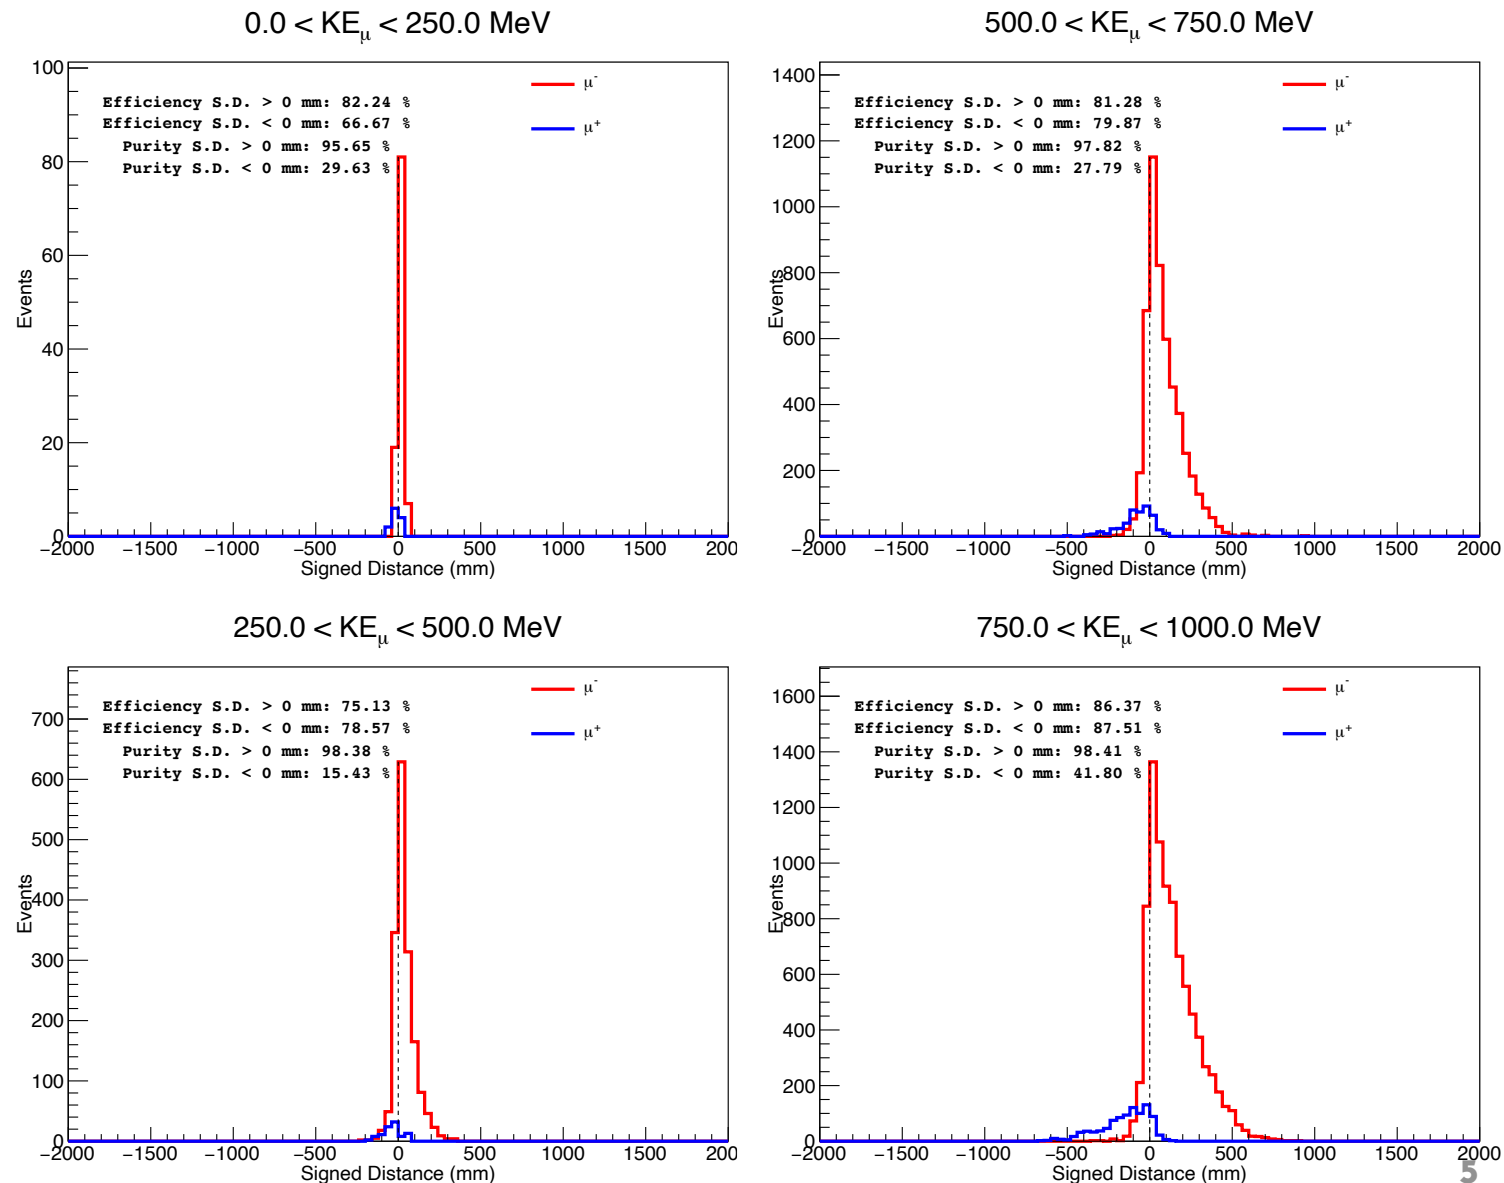

efficiency $\mu = \text{events of } SD > 0 / \text{ all } \mu \text{ events}$

purity $\mu = \mu \text{ events of } SD > 0 / \text{ all events of } SD > 0$

- Took Sushil's code slightly further:

- made an attempt at an efficiency and purity metric.
- broke down the muon KE into finer binning at the low and high KE ranges.

$$S.D = (x_3 - x_1) - (x_2 - x_1)(z_3 - z_1)/z_2 - z_1$$

Signed distance

efficiency $\mu = \text{events of } SD > 0 / \text{ all } \mu \text{ events}$

purity $\mu = \mu \text{ events of } SD > 0 / \text{ all events of } SD > 0$

▸ Took Sushil's code slightly further:

- made an attempt at an efficiency and purity metric.
- broke down the muon KE into finer binning at the low and high KE ranges.

$$S.D = (x_3 - x_1) - (x_2 - x_1)(z_3 - z_1)/z_2 - z_1$$

4000.0 < KE_μ < 4250.0 MeV

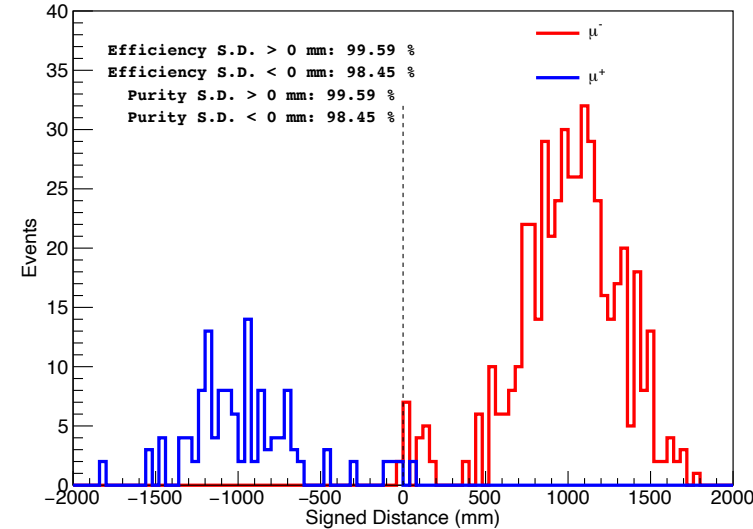

4500.0 < KE_μ < 4750.0 MeV

4250.0 < KE_μ < 4500.0 MeV

4750.0 < KE_μ < 5000.0 MeV

Next Steps

- Showed some metrics of identifying sign of muon using sign distance.
 - These are not *exactly* efficiency and purity metrics.
 - Unsurprisingly, these are more relevant for low KE muons.
 - Insufficient statistics from RHC, would like to have more μ^+ events for these metrics.
 - Planning on using other `tmsreco` files of different B fields and calculate the metrics there — hope to produce a single plot of all sign distance distributions.
- Would welcome input on **what other metrics** people would like to see.
