

Alex Himmel, Duke University
for the Super-Kamiokande Collaboration

Super-Kamiokande

- Water Cherenkov detector
- 22.5 kton fiducial mass
- ~1 km underground
- 40% photo-coverage of inner detector
- Active veto outer detector

Atmospheric Neutrinos: wide range of energies and distances

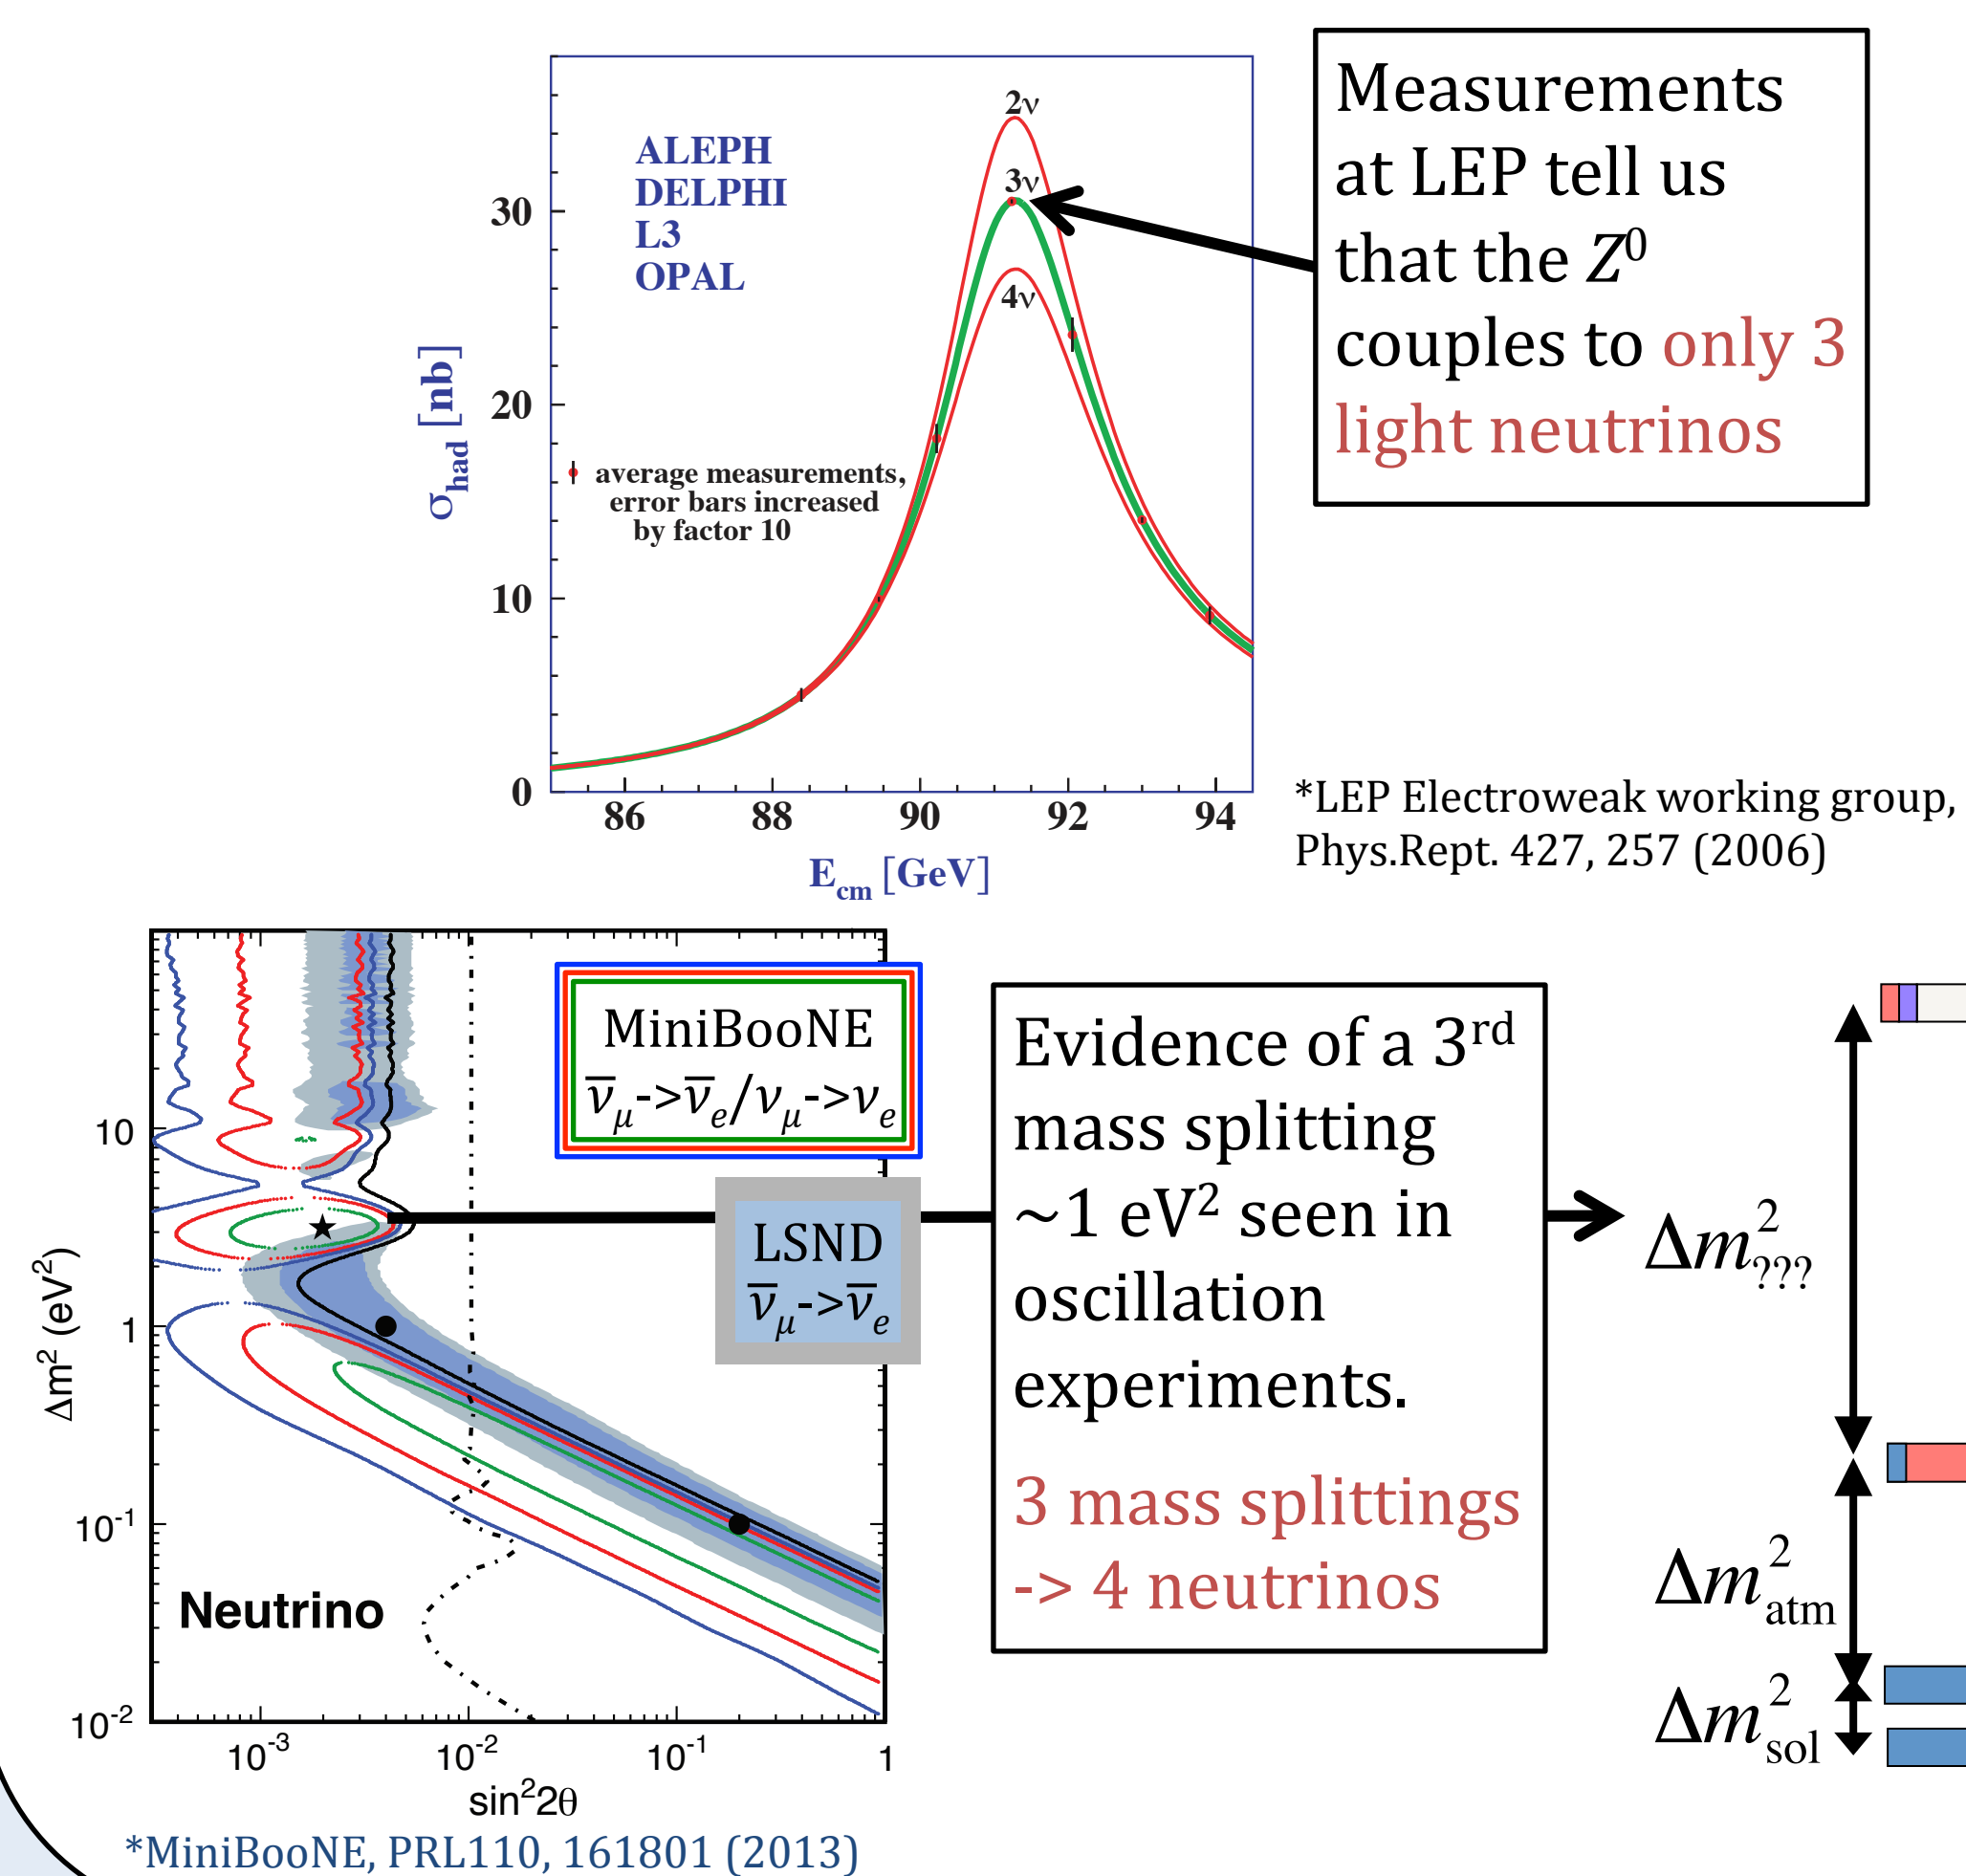

Systematic Errors

- Shared with official oscillation analysis and between Sterile and Lorentz Violation analyses
- Covers atmospheric flux, cross-sections, and detector effects
- External constraints with uncertainties from T2K:
 $|\Delta m_{32}^2| = (2.51 \pm 0.10) \times 10^{-3} \text{ eV}^2$ and $\sin^2 \theta_{23} = 0.514 \pm 0.055$

*T2K Collab., PRL112, 181801 (2014)

Oscillations, No Interactions

Measurements at LEP tell us that the Z^0 couples to **only 3 light neutrinos**

Evidence of a 3rd mass splitting ~1 eV² seen in oscillation experiments.
3 mass splittings -> 4 neutrinos

Our 3+1 Model: Extendable to 3+N

Assumptions

- No ν_e -sterile oscillations ($|U_{e4}|^2 \rightarrow 0$)
- Δm^2 is large, $\sin^2(\Delta m^2 L/4E) \rightarrow 0.5$
- Sterile phases neglected

$$P_{\mu\mu} = (1 - |U_{\mu 4}|^2)^2 \tilde{P}_{\mu\mu} + |U_{\mu 4}|^4$$

Hydrogen-Earth Approx.

- $\tilde{P}_{\mu\mu}$ from standard 3 ν osc.
- Includes normal ν_e appearance
- No sterile matter effects

No ν_e Approximation

- $\tilde{P}_{\mu\mu}$ from 2 ν osc. with sterile matter effects
- $\tilde{P}_{\mu\mu}$ depends on: $|U_{\tau 4}|^2, |U_{\mu 4}|^2, \theta_{23}, \Delta m_{32}^2$
- No ν_e appearance

*M. Maltoni and T. Schwetz, PRD76, 093005 (2007).

Standard Model Extension

$$H = U \Delta U^\dagger + V_e + H_{LV}$$

Vacuum Osc.

Matter Effects

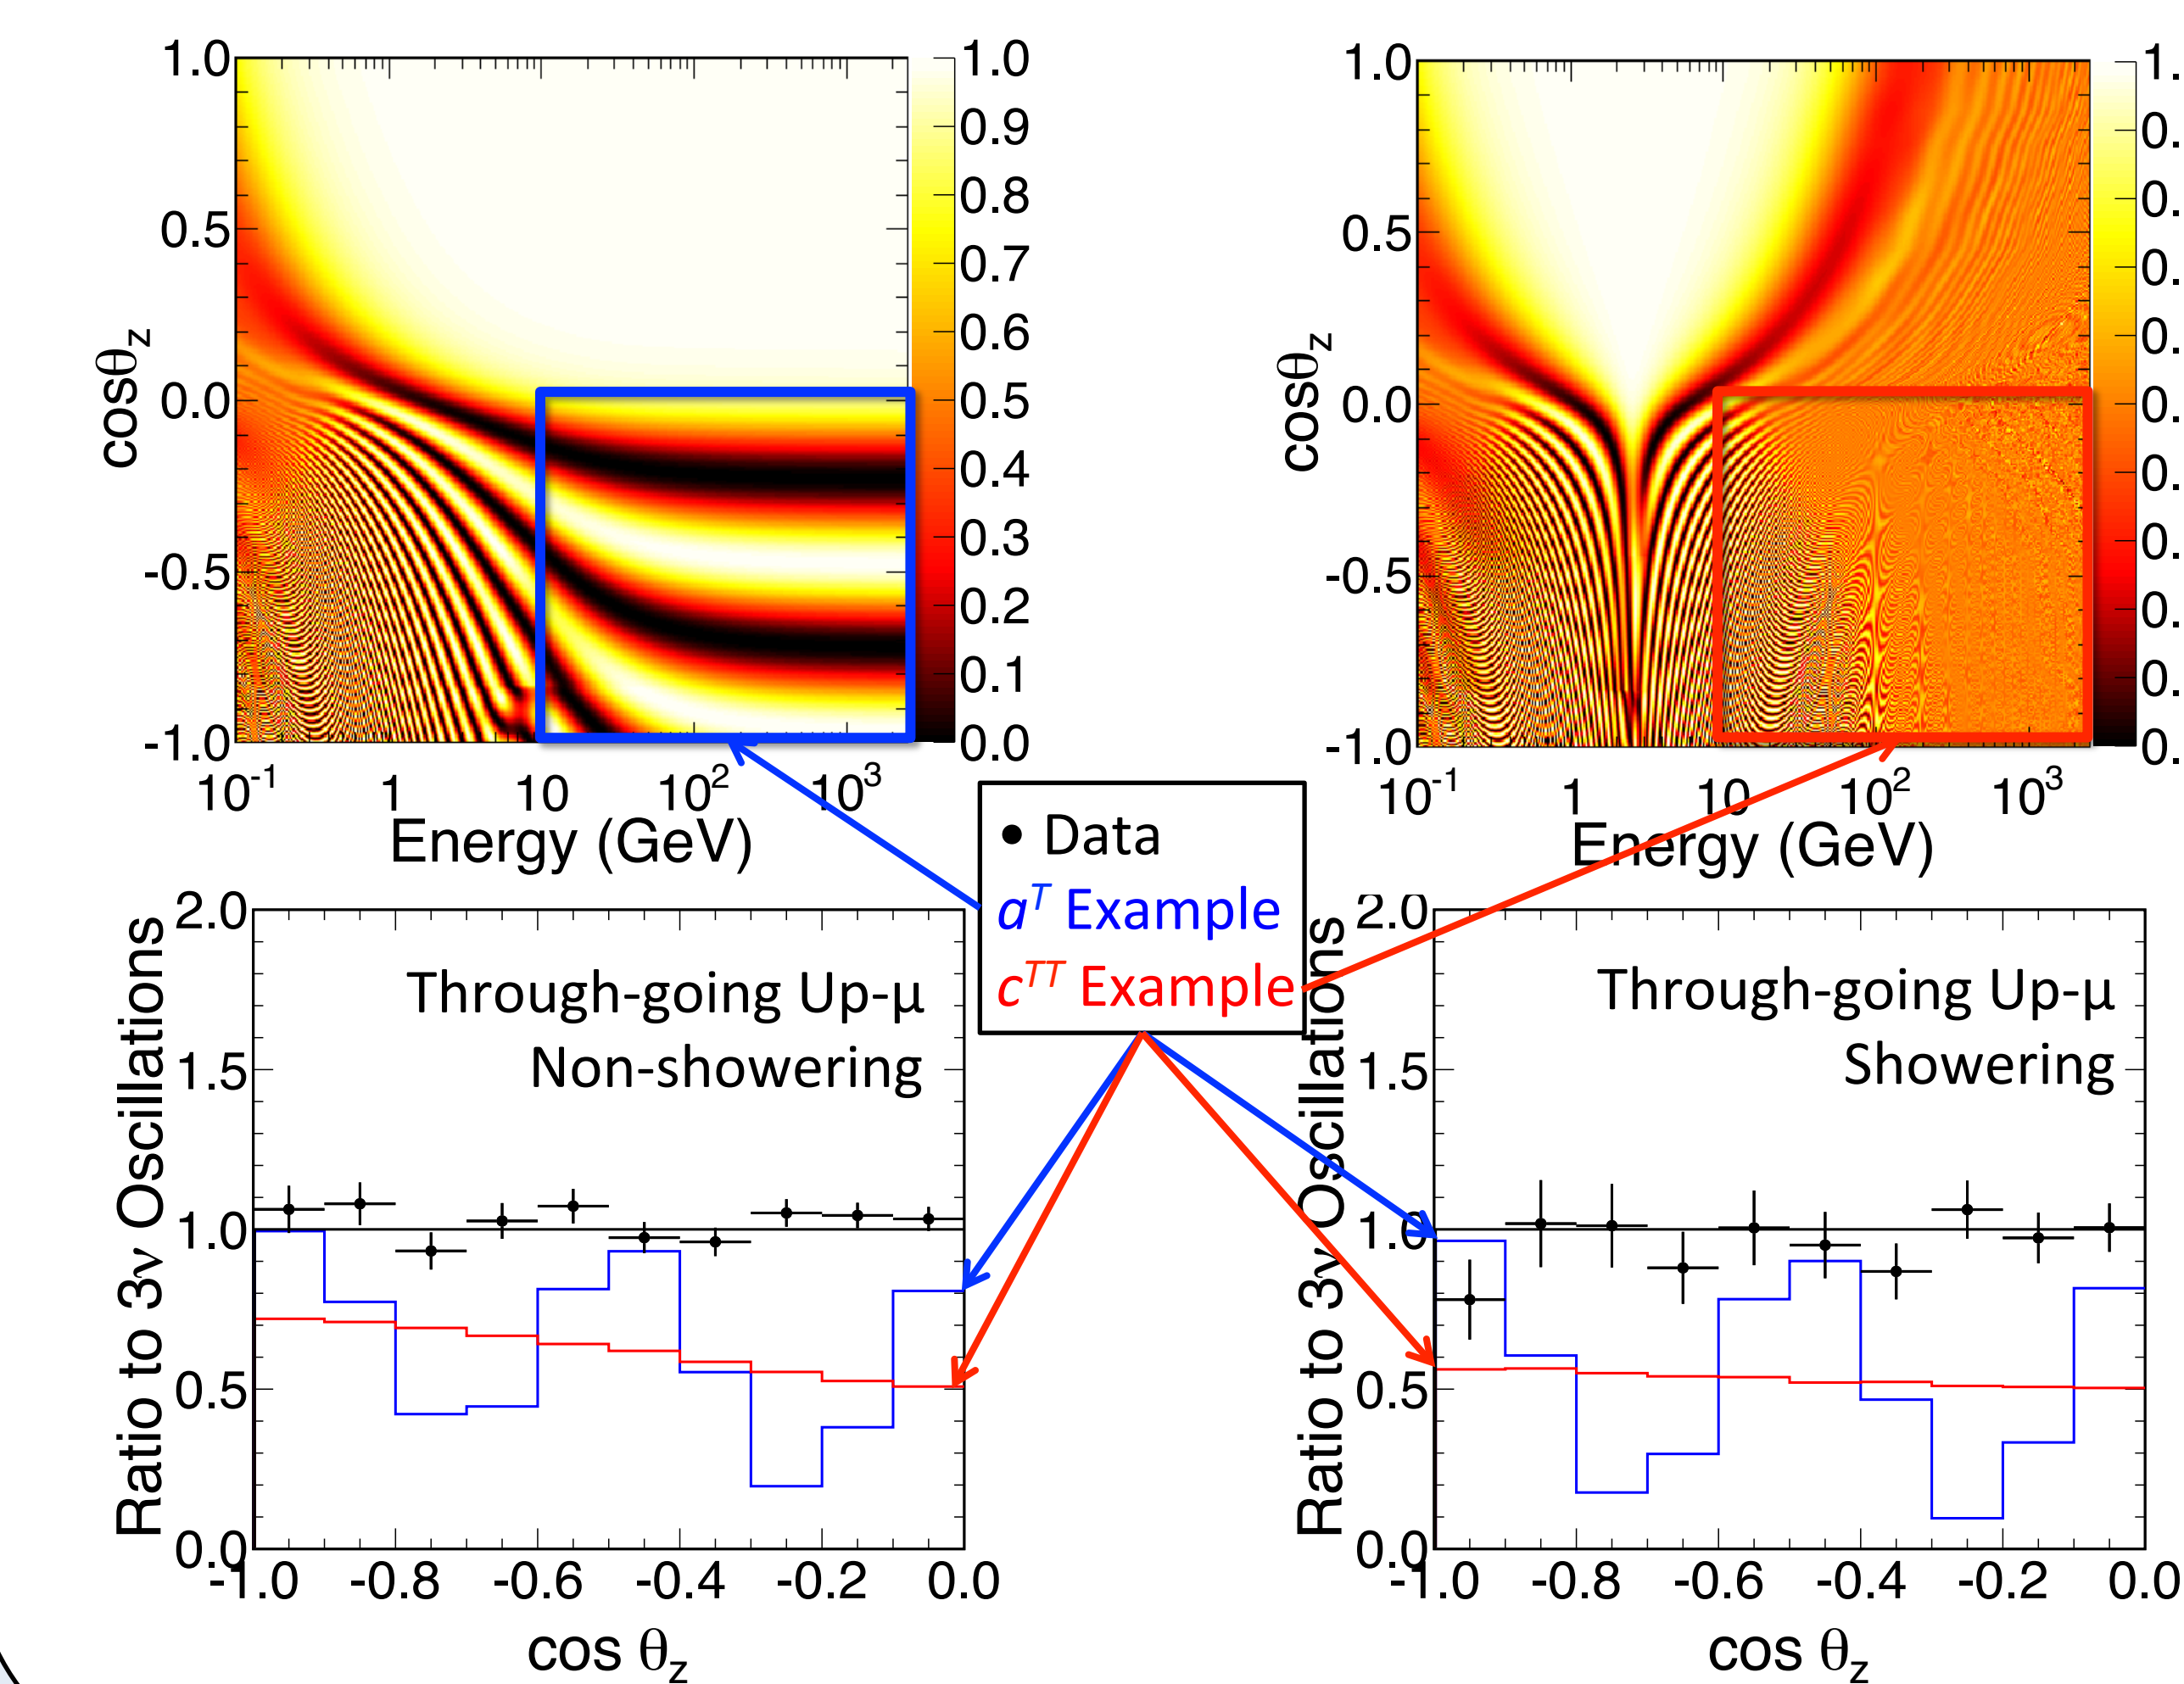

$$H_{LV} = \pm \begin{pmatrix} 0 & a_{e\mu}^T & a_{e\tau}^T \\ a_{e\mu}^T & 0 & a_{\mu\tau}^T \\ a_{e\tau}^T & a_{\mu\tau}^T & 0 \end{pmatrix} - E \begin{pmatrix} 0 & c_{e\mu}^{TT} & c_{e\tau}^{TT} \\ c_{e\mu}^{TT} & 0 & c_{\mu\tau}^{TT} \\ c_{e\tau}^{TT} & c_{\mu\tau}^{TT} & 0 \end{pmatrix}$$

- All the properties of the Standard Model & General Relativity
- Adds all general Lorentz- and CPT-violating terms
- T, TT - isotropic parameters
- Often, H_{LV} treated as a perturbation
- **SK cannot treat as perturbation** - L and E are too large
- Instead, we diagonalize the full Hamiltonian

Signatures

Lorentz Violation

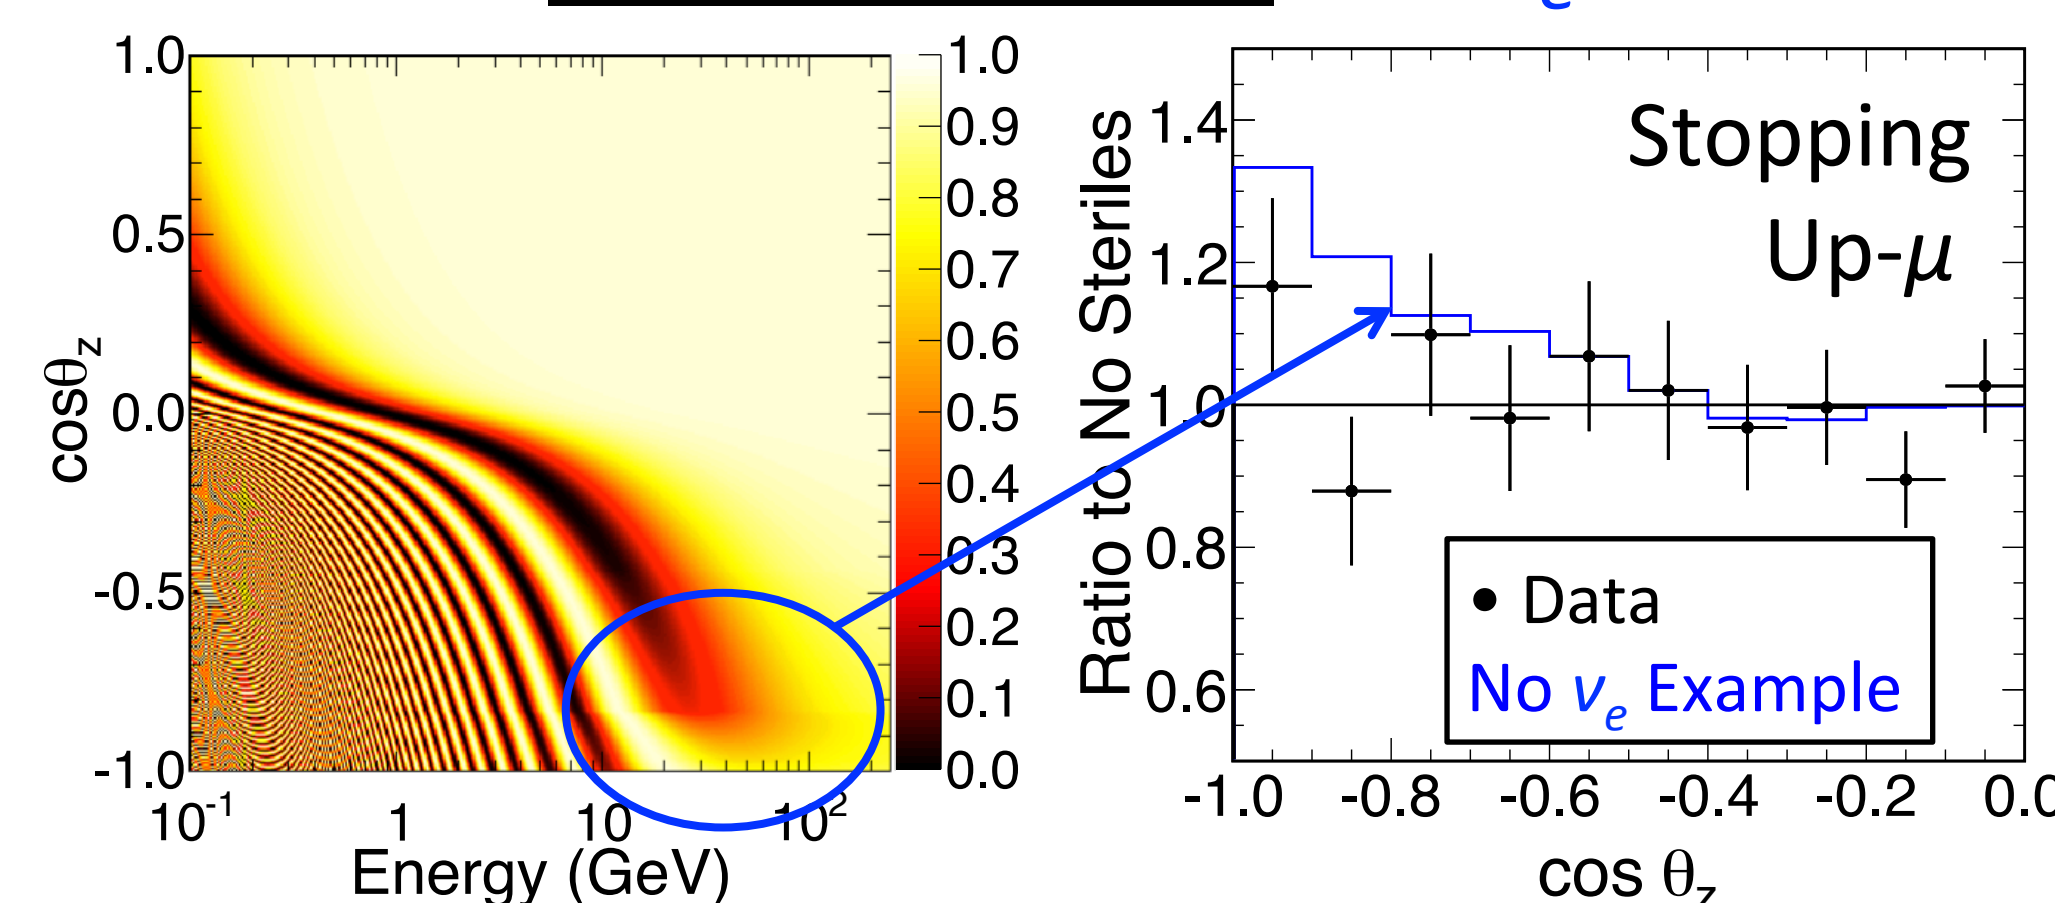

Sterile Neutrinos

Signatures: Hydrogen-Earth

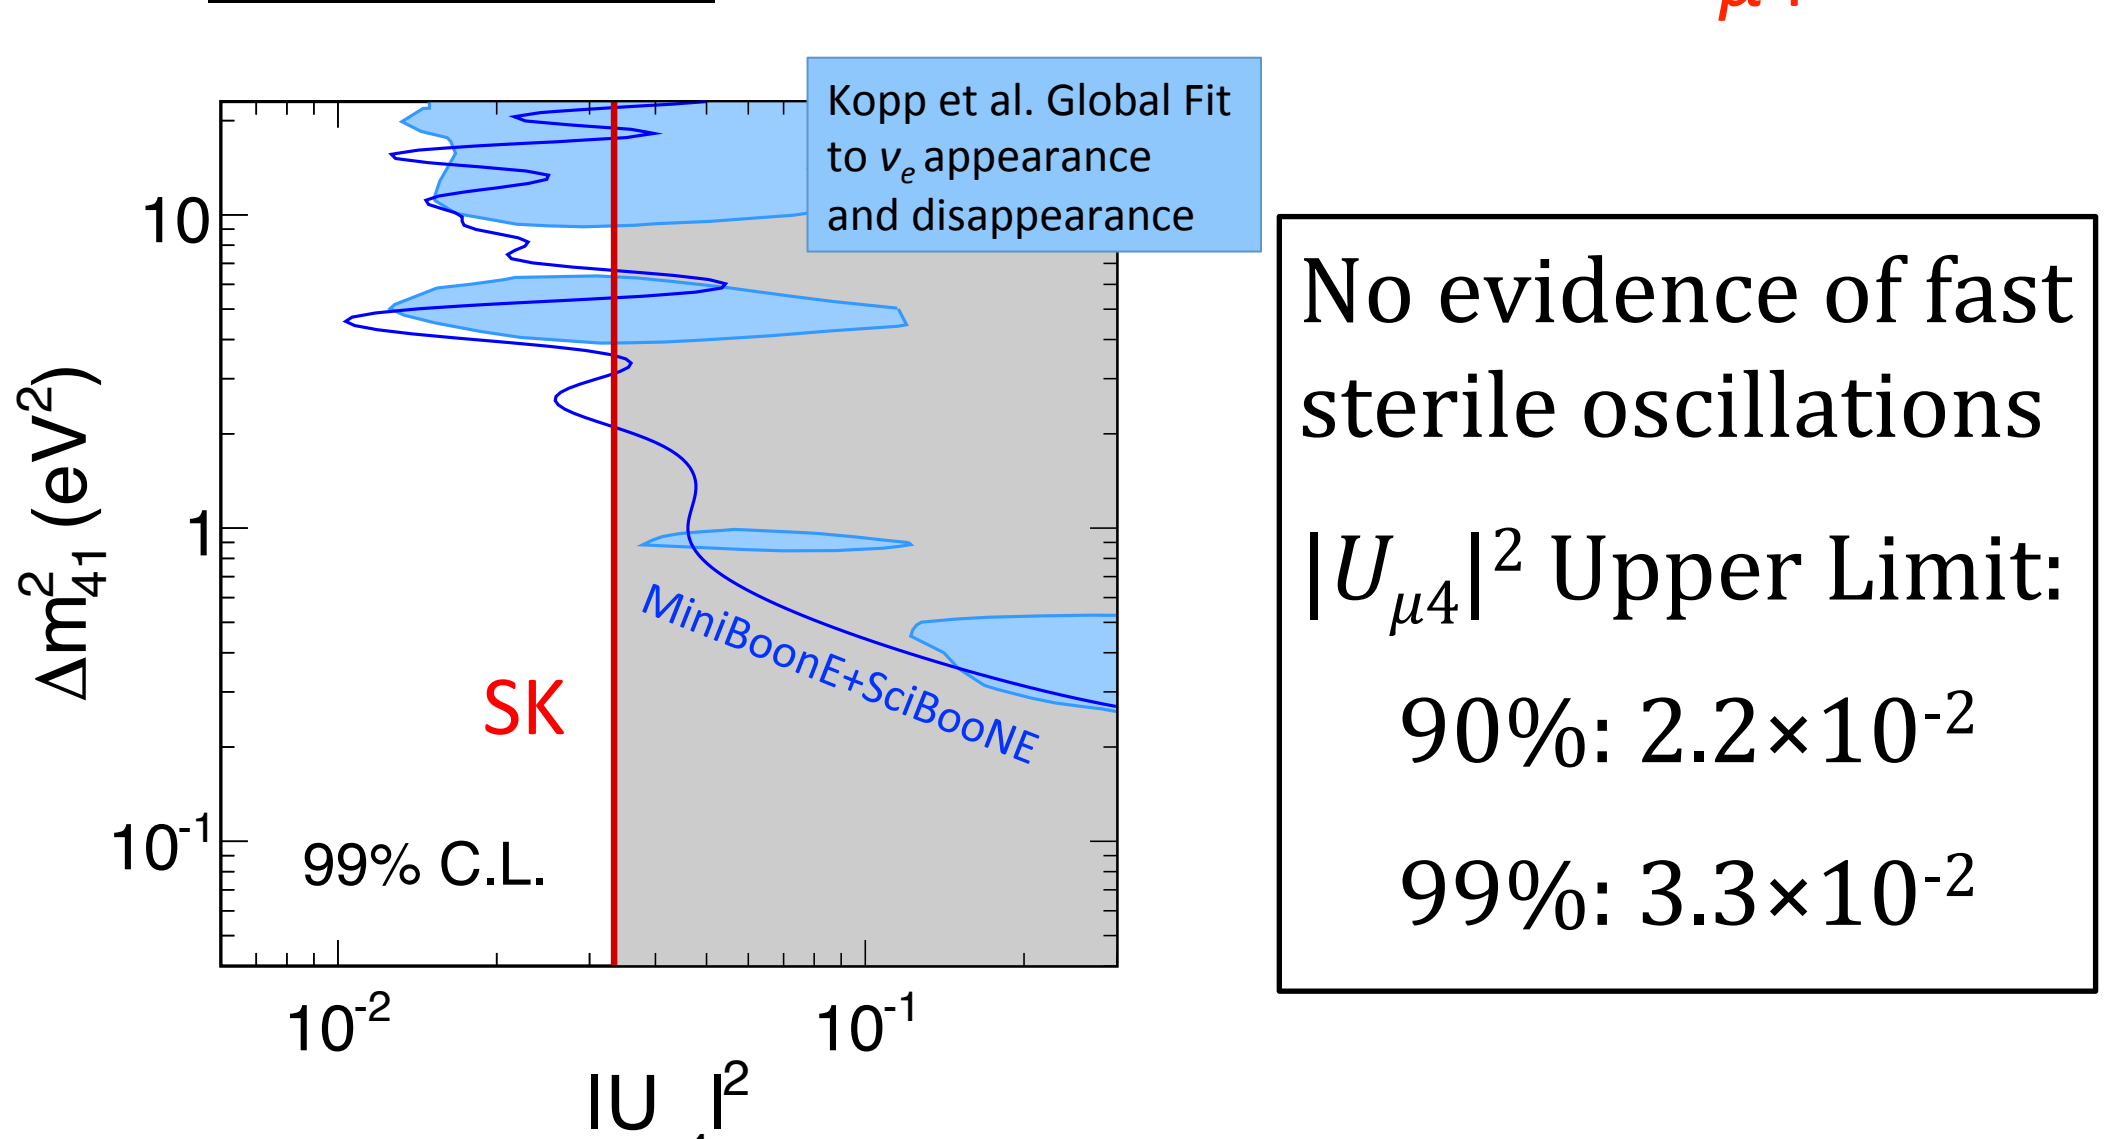

- **Extra disappearance** in all μ -like samples, particularly away from **standard oscillations**.
- Unbiased estimate of $|U_{\mu 4}|^2$
- Use only FC, PC bins $\rightarrow \Delta m^2 > 10^{-2} \text{ eV}^2$

Signatures: No ν_e

- **Distortion** in most upward going parts of stopping Up- μ and through-going PC stopping
- Biased estimate of $|U_{\mu 4}|^2$
- Up- μ bins important for sterile matter effects $\rightarrow \Delta m^2 > 0.8 \text{ eV}^2$

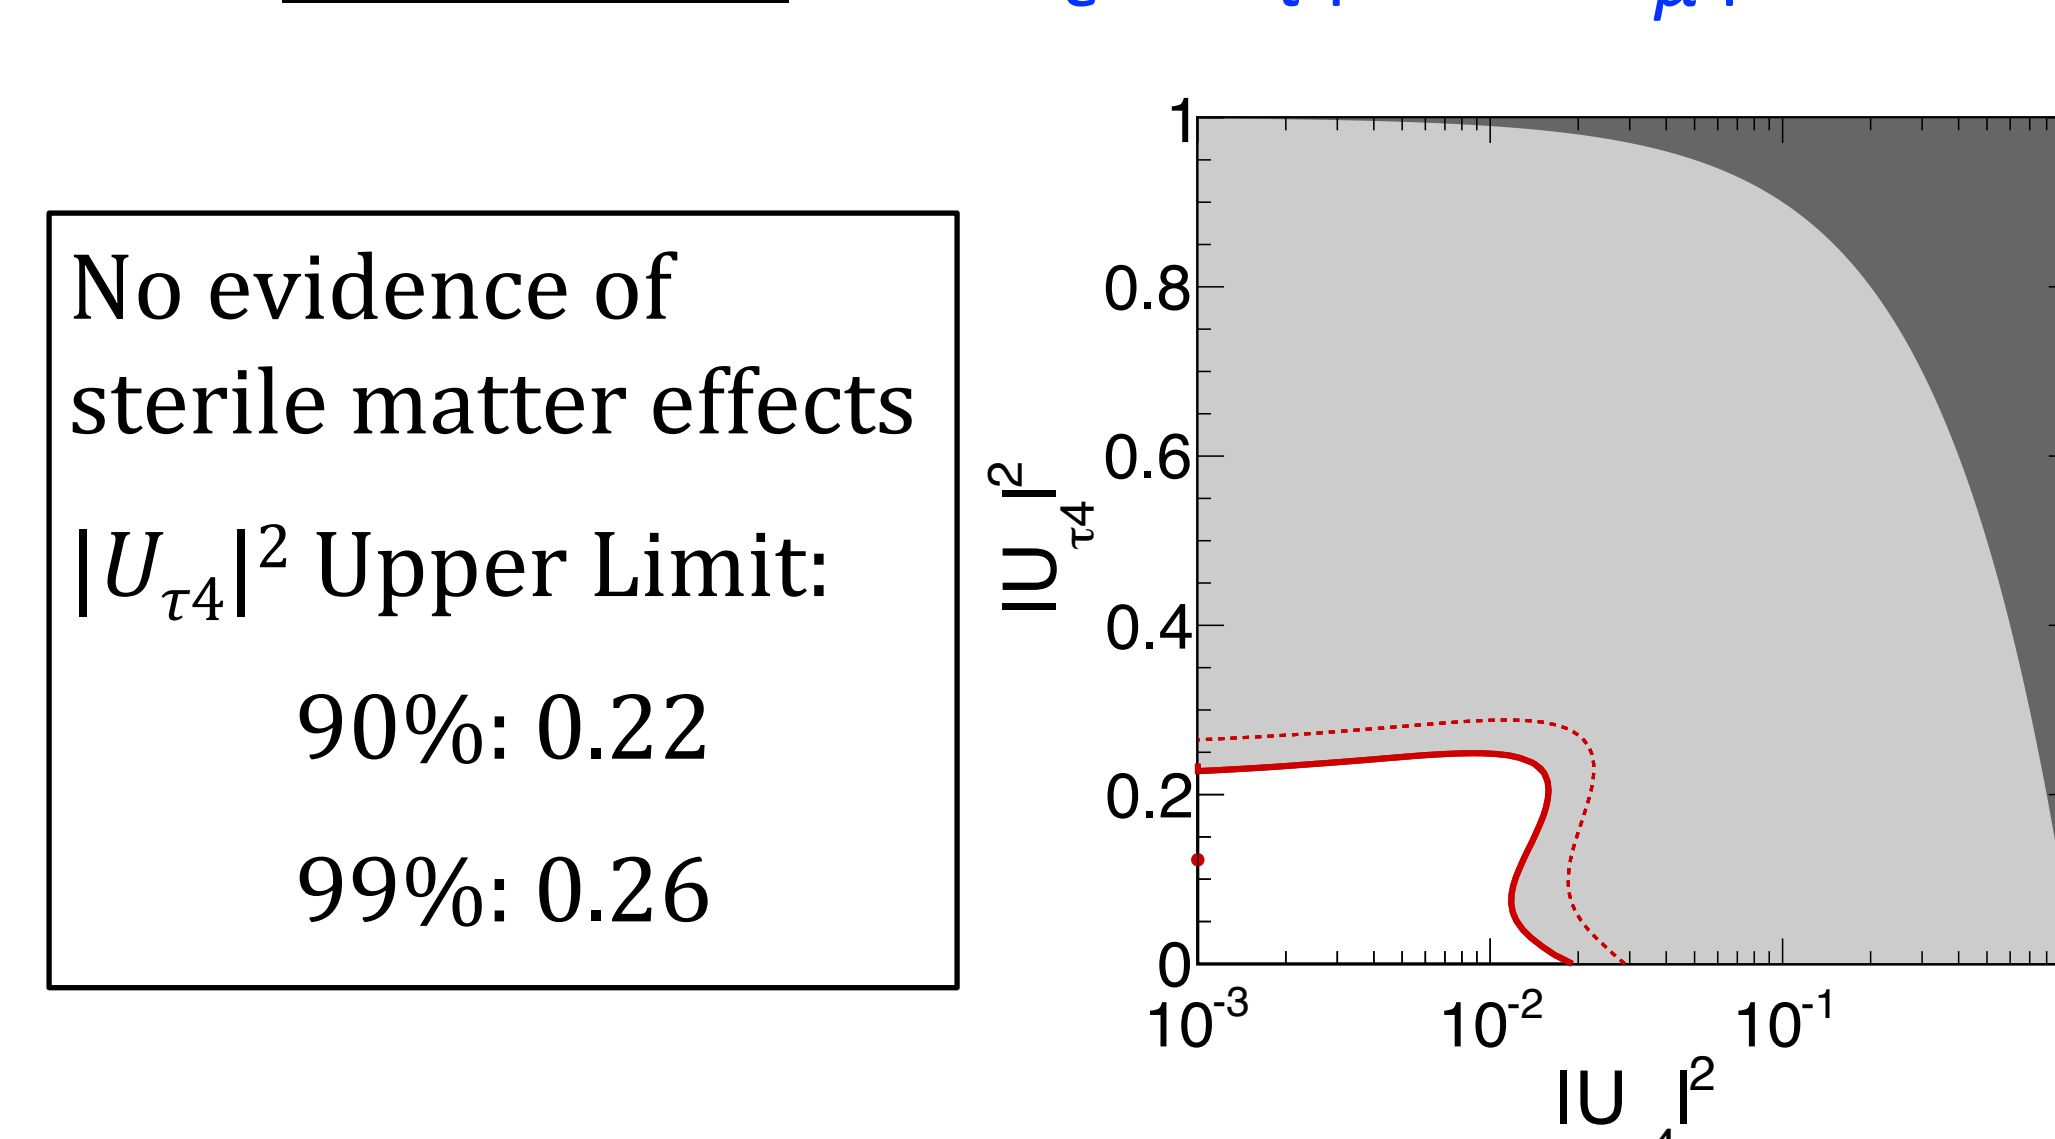

Results: Hydrogen-Earth $|U_{\mu 4}|^2$

No evidence of fast sterile oscillations
 $|U_{\mu 4}|^2$ Upper Limit:
90%: 2.2×10^{-2}
99%: 3.3×10^{-2}

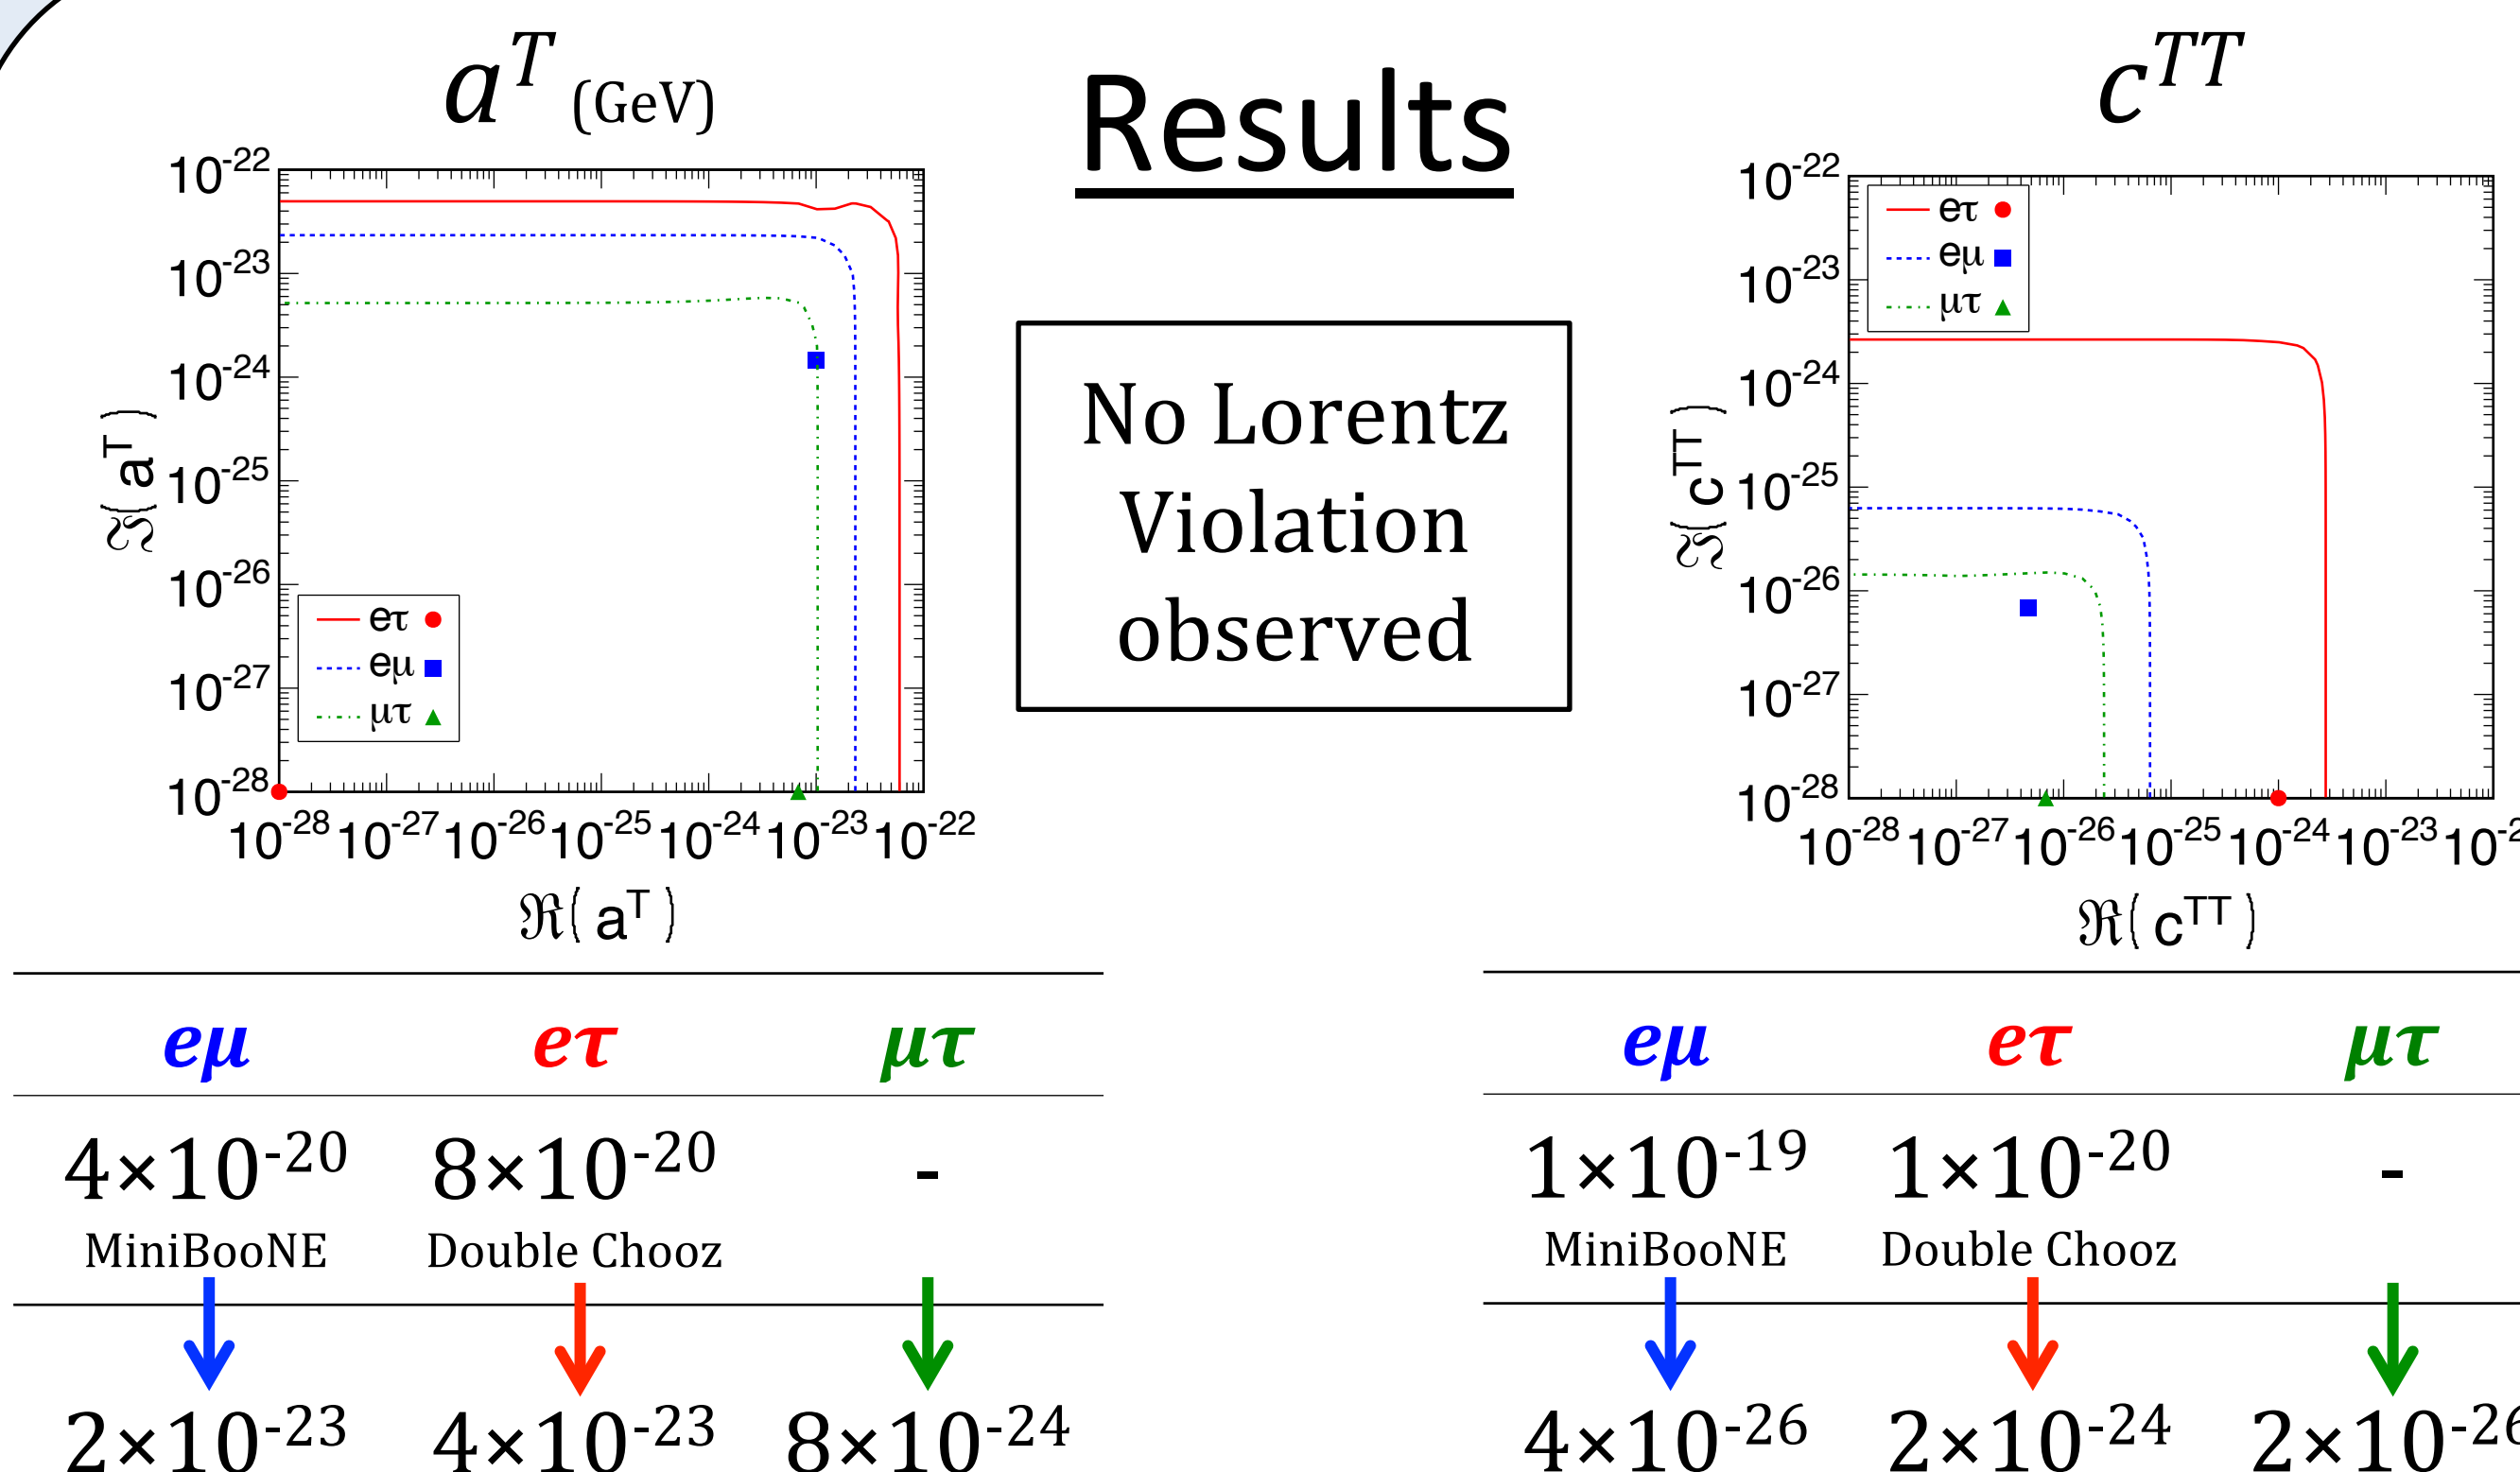

*MiniBooNE and SciBooNE Collaborations, PRD86, 5, 052009 (2012)
*Kopp, Machado, Maltoni, Schwetz, JHEP 5, 50 (2013)

Results: No ν_e $|U_{\tau 4}|^2, |U_{\mu 4}|^2$

No evidence of sterile matter effects
 $|U_{\tau 4}|^2$ Upper Limit:
90%: 0.22
99%: 0.26

Results

No Lorentz Violation observed
