

## The MINERvA experiment

*Monday, 9 June 2014 13:50 (20 minutes)*

MINERvA (Main INjector Experiment for  $\nu$ -A) is a neutrino scattering experiment in Fermilab's NuMI high-intensity neutrino beam. MINERvA was designed to make precision measurements of low energy neutrino and antineutrino cross section on a variety of materials including plastic scintillator, C, Fe, Pb, He and water. An overview of the experiment and a description of the detector will be presented.
