# LBNE Muon System Tests

Geoffrey Mills Los Alamos National Laboratory <u>mills@lanl.gov</u>

#### NBI 2014 September 26, 2014

NBI – 25 September, 2014

#### LBNE-NuMI ND Muon System Program

#### • Collaboration:

- University of Colorado: A. Marino, Zack Liptak, and Eric Zimmerman +students
- Drexel University: Chuck Lane +students
- Los Alamos: Geoff Mills, Jan Boissevain + others
- Fermilab: Cory Crowley, Paul Kasley, Mark Averett, Tom Zuchnik, Mike Andrews, and others
- CERN: Heinz Pernegger, Hendrick Jansen, Matevs Cevn
- Muon measurements after the absorber
  - Single particle environment (nearly)
  - Muons are created in pion and kaon decays and bear directly on neutrino production
  - Rely only upon knowing muon energy loss and scattering in the absorber material
  - Complements other flux measurements:
    - external hadro-production measurements don't include horn and decay tunnel
    - ND neutrino measurements rely on knowing neutrino-nucleus cross sections and relative near/far detector efficiencies

# LBNE Beam Configuration (older design...)

#### **Muon-Neutrino Correlation**

- Muons and neutrinos are anticorrelated in the two-body decays of pions and kaons
- Muons take most of the momentum in the decay
- For pions:
  - $\circ E_{v} = (0 0.43)E_{\pi}$
  - $\circ E_{\mu} = E_{\pi} E_{\nu} = (0.57 1.0)E_{\pi}$

# LBNE Prototype Tests at NuMI

- Capitalize on opportunity to test those devices in NuMI beam during the Nova run
- Planning started August 2012
- Infrastructure put into place spring 2013
- First Cherenkov detector prototypes in place August-September 2013
- First signals observed in October, 2013
- Alcove Operational Readiness Review in February,2014
- Engineering for Alcove 1 installation in progress
- Alcove 1 installation expected after September Main Injector shutdown

#### Muon Spectra Before NuMI Absorber

NBI – 25 September, 2014

# Alcove 2

Racks

#### LBNE/NuMI Cherenkov Counter

• Pressure varied from 2 atm to vacuum

PMT

Threshold Momentum 2.20 GeV to 200 GeV

Muon Beam from NuMI decay tunnel

Window Assembly

Black Flocked Liner ABS Plastic Rings

NBI – 25 September, 2014

#### **Cherenkov Gases**

| Gas             | (n-1) <sub>stp</sub> (× 10 <sup>6</sup> ) | $P_0^{STP}$ (GeV/c) | $\theta_{c}^{\text{STP}}$ (mrad), $P \rightarrow \infty$ | Photons/m |
|-----------------|---|---------------------|--|-----------|
| Nitrogen        | 298                                       | 4.33                | 24.4   | 22        |
| Oxygen          | 271                                       | 4.54                | 23.3   | 20        |
| Argon           | 281                                       | 4.45                | 20.8   | 20.7      |
| Neon            | 67.1                                      | 9.12                | 11.6   | 5.0       |
| Helium          | 35.0                                      | 12.65               | 8.37   | 2.6       |
| CO <sub>2</sub> | 449                                       | 3.52                | 30.0   | 33        |

Table 1 Properties of several standard gases used in Cherenkov counters.

#### Argon Gas as a Cherenkov Radiator

| Pressure | $P_0$ (GeV/c) | θ <sub>c</sub> (mrad) | Photons/m |
|----------|---------------|-----------------------|-----------|
| (atm)    |               | P→∝                   | P→∝       |
| 5×10-4   | 200           | 0.5                   | 0.5       |
| 0.1      | 44.5          | 2.1                   | 2.1       |
| .5       | 6.29          | 6.6                   | 6.5       |
| 1        | 4.45          | 14.7                  | 14.6      |
| 3        | 2.57          | 20.8                  | 20.7      |
| 10       | 1.41          | 36.0                  | 35.9      |
| 20       | 1.00          | 93.0                  | 92.6      |

#### Table 2 The behavior of visible Cherenkov light from muons in Argon gas.

#### At NuMI Alcove 2, about 10<sup>5</sup> muons/cm<sup>2</sup> are expected

NBI – 25 September, 2014

#### **Radiator Section**

#### **Typical NuMI Beam Pulse**

#### Beginning of Pulse Train (50 MHz RF)

### Cherenkov Response Versus Pitch Angle

![](_page_17_Figure_1.jpeg)

NBI – 25 September, 2014

### Cherenkov Response Versus Yaw Angle

![](_page_18_Figure_1.jpeg)

## **Cherenkov Response Versus Pressure**

![](_page_19_Figure_1.jpeg)

## **Future Plans**

- Alcove 2 Cherenkov counter phase II upgrade to full pressure operation (nearly complete)
- Installation of diamond ionization detectors (DDs) (CU & CERN)
- Installation of Alcove 1 Cherenkov counter system
- Development of Stopped Muon Counter (SMCs) (see next talk)

#### CERN Diamond Detectors (H. Pernegger et. al.)

![](_page_21_Figure_1.jpeg)

# Alcove 1 Layout

![](_page_22_Picture_1.jpeg)

# Summary

- Alcove 2 Cherenkov System seems to functioned well in phase I operation
- Phase 2 operation at full pressure will commence after shutdown
- Signals from Cherenkov counter look very encouraging
- Future installations into alcove 1 including DDs and SMCs
