## Outline

- Design Overview
- Trajectory
- Magnets
- Optics
- Lattice Functions
- Beam Envelope \& Magnet Apertures
- Final Focus \& Spot Size Tuning
- MI-10 Extraction
- Summary
- Other Stuff
- Sensitivity to Gradient Errors
- Trajectory Control
- Power Supply Ripple Effects
- Known Interferences
- Magnet Parameters

2MI-10 7unnel $\rightarrow$ LBNE Enclasure Transfer

Transport from the existing MI tunnel enclosure into the new LBNE enclosure showing the carrier pipe connecting the MI-10 \& LBNE enclosures (left), and separation of Q204 at the $u / s$ end from the Main Injector \& Recycler Rings (right).

## Primary Beam \& Hill Crass-section

## THE PRIMARY BEAMLINE EXTRACTS PROTONS FROM MI-10 \& TRANSPORTS TO THE TARGET ABOVE GRADE

BLC apex elev. @ 30 ft above grade (Target eleV. O 10 ft above grade

## Aerial Viem of LBNE Trajectory

## Trajectory

- Beam is extracted vertically from $\mathrm{MI}-10$ via 5 horizontal kicker modules $\mathrm{d} / \mathrm{s}$ of MI quad Q100, and 3 Lambertsons plus a C-magnet straddling MI Q102.
- A rolled dipole steers the beam through the enclosure wall, while bisecting the MI \& Recycler magnet elevations.
- In the LBNE tunnel the beam is bent $7.2^{\circ}$ horizontally to align with SURF in South Dakota, and upwards by 143 mr . A second series of vertical dipoles bend the beam down through 244 mr to complete vertical alignment to SURF, with $\phi=-101 \mathrm{mr}$.
- Target elevation is fixed at 750 ft ( $\sim 10 \mathrm{ft}$ above grade) \& maximum BLC elevation is 770 ft ( $\sim 3$ stories above grade).
- Distance from MCZERO to center of LAr FD $=1286873.765 \mathrm{~m} \pm$

LBnE - the Ride

## Magnet Camplement

- All major magnets are well-understood, proven designs
- In the main body of the line all dipoles are Main Injector-style IDA/IDB (6m) \& IDC/IDD (4m) magnets
- Quadrupoles are all of the MI-style 3Q120 (3.048 m) or the shorter 3Q60 version (1.524m)
- New IDS trims have 3" pole tip gap \& design spec of $250 \mu r$ (RMS).

| Magnet | Common Name | Steel Length | Strength at 120 GeV | Count |
| :--- | :---: | :---: | :---: | :---: |
| Kickers | NOvA extraction type | 1.295 m | 0.0589 T | 5 |
| ILA | MI Lambertson | 2.800 m | $0.532 / 1.000 \mathrm{~T}$ | 3 |
| ICA | MI C Magnet | 3.353 m | 1.003 T | 1 |
| IDA/IDB | MI Dipole 6 m | 6.100 m | $1.003-1.604 \mathrm{~T}$ | 13 |
| IDC/IDD | MI Dipole 4 m | 4.067 m | $1.003-1.604 \mathrm{~T}$ | 12 |
| QQB | MI 3Q120 quadrupole | 3.048 m | $9.189-16.546 \mathrm{~T} / \mathrm{m}$ | 17 |
| QQC | LBNE 3Q60 quadrupole | 1.524 m | $11.135-17.082 \mathrm{~T} / \mathrm{m}$ | 4 |
| IDS | LBNE trim dipoles | 0.305 m | Up to 0.365 T | 23 |

- IDA/IDB sagitta $=11.7 \rightarrow 18.6 \mathrm{~mm}$
- IDC/IDD sagitta $=5.2 \rightarrow 8.3 \mathrm{~mm} \quad$ c.f. 7 mm design nominal

## Optics

- To avoid losses the beam size in the LBNE transfer line can not exceed that of the Main Injector circulating beam.
- The ultra-clean transport requirements virtually compel the lattice to be configured from distinct optical modules.
- Every focusing center has a dual-plane BPM \& dipole corrector
- Every half-cell has space reserved for a multi-wire or other diagnostics.
- Spot-size on target must be tunable over a wide range: from $\sigma$ ~ 1.0 $\rightarrow \sim 4.0 \mathrm{~mm}$ to accommodate a beam power upgrade to 2.4 MW .
- Physics dictates it must also be continuously tunable over the range $60 \rightarrow 120 \mathrm{GeV} / \mathrm{c}$ for optimizing the neutrino oscillation spectrum.

Satisfying the above conditions requires that the final focus $\beta^{*}$ be tunable over a range x32 (!).

- Subsequent discussions, unless stated otherwise, assume nominal MI beam parameters of $\varepsilon_{99}=30 \pi \mu \mathrm{~m}$ (normalized) \& $\Delta p_{g 9} / p=11 . e-4$, with $\sigma^{*}=1.50 \mathrm{~mm}$.

## Lattice Functions

Horizontal (solid) and vertical (dashed) lattice functions of the LBNE transfer line The final focus is tuned for $\sigma_{x}=\sigma_{y}=1.50 \mathrm{~mm}$ at $120 \mathrm{GeV} / \mathrm{c}$ with $\beta^{*}=86.33 \mathrm{~m}$ and nominal MI beam parameters $\varepsilon_{99}=30 \pi \mu \mathrm{~m} \& \Delta p_{99} / p=11 \times 10^{-4}$

## Beam Enuelopes \& Magnet Apertures

$120 \mathrm{GeV} / \mathrm{c}$ Beam Envelope \& Magnet Apertures
Dipole apertures, shown in blue, include the effects of sagitta \& rolls.
Quadrupole apertures are red.

- The 99\% envelopes (dashed) represent nominal MI beam parameters

$$
\left[\varepsilon_{99}=30 \pi \mu \mathrm{~m} \& \Delta \mathrm{p}_{99} / \mathrm{p}=11 . \mathrm{e}-4\right] ;
$$

- The $100 \%$ envelopes (solid) correspond to the Ml admittance at transition. $\left[\varepsilon_{100}=360 \pi \mu \mathrm{~m} \& \Delta \mathrm{p}_{100} / \mathrm{p}=28 . \mathrm{e}-4\left(\gamma_{\mathrm{t}}=21.600\right)\right]$

The beamline can transport, without losses, the worst quality beam that the MI could conceivably transfer.

## Final Facus \& Spot-Size Tuning

The extremes shown correspond to: $60 \mathrm{GeV} / \mathrm{c}$ with $\sigma^{*}=1.0 \mathrm{~mm} ; \beta^{*}=19.184 \mathrm{~m}$ and $\beta \mathrm{max}=104 \mathrm{~m}$ (lower), and; at $120 \mathrm{GeV} / \mathrm{c}$ with $\sigma^{*}=3.20 \mathrm{~mm} ; \beta^{*}=393 \mathrm{~m}$ and $\beta$ max $=483 \mathrm{~m}$ (upper). Horizontal values are displayed as solid curves \& vertical values are dashed.

In principle the spot-size can be tuned to $\sigma^{*}=4.00 \mathrm{~mm}$, but the 3.20 mm limit arises from the $360 \pi$ $\mathrm{mm}-\mathrm{mr}$ horizontal acceptance of the final down bend.

## 2M9-10 Extraction

MI Q104 looking upstream

## Extraction Element Configuration

LBNE extraction Lambertsons and C-magnet straddling MI quad Q102

- LBNE extraction elements and their configuration are clones of those found at other MI extraction points.

## Clased Orbit \& Extraction Frajectory through MI-10

## Beam-Beam Separation in Quad 102

Large Aperture Quad $55 / 8 \times 5 / 8$ Star Chamber

Circulating \& extracted beams through Lam1 \& Q102

- Closed orbit bump is created by transverse offsets of focusing quads.
- Kickers create 36.2 mm separation at the $1^{\text {st }}$ Lambertson entrance between circulating \& extracted beams.

## MIARS Extraction Tracking

- Normalized 100\% beam emittance is $\varepsilon_{100}=360 \pi \mathrm{~mm}-\mathrm{mr}$
- 10,000 points are selected on a surface in 4-dimensional ( $x, x^{\prime} ; y, y^{\prime}$ ) phase space
- Extraction tracking is from the u/s end of Q100 to the end of the $3^{\text {rd }}$ Lambertson

## Beam-Beam Separations from MARS

Position of beams at the entrance (left) and exit of qudrupole Horizontal shifts for all quadrupoles are defined in optics.

cm Exit of Lambertson 3

## Summary

- Beam is extracted at MI-10 \& transported to a target above grade.
- The lattice design is comprised entirely of proven MI-style magnets.
- MI-10 extraction configuration \& the beamline provide for loss-free transmission of a 10.6б beam.
- The final focus is continuously tunable from $\sigma^{*}=1.00 \rightarrow 4.00 \mathrm{~mm}$ over the entire momentum range $60 \rightarrow 120 \mathrm{GeV} / \mathrm{c}$
$\Omega$

## Other Stuff

- Sensitivity to Gradient Errors
- Trajectory Control
- Power Supply Ripple Effects
- Known Interferences
- Magnet Parameters

## Sensiticity to Gradient Errors

- Not An Issue!
- Experience has shown the MI-style 3 Q 120 quadrupoles to be of very high accelerator quality ${ }^{\dagger}$
- $\sigma(\Delta \mathrm{G} / \mathrm{G}) \sim 0.08 \%$ or less, which can be reduced even further for the FODO section with only rudimentary sorting.
- A simple thin-lens calculation predicts that even the largest error-wave generated in the $99 \%$ beam envelope $[ \pm 3.74 \mathrm{~mm}$ at $\beta=59.6 \mathrm{~m}$ ] would be $<70$ microns.

## Trajectory Cantrol

Uncorrected/corrected trajectories with random misalignments and dipole field errors
The plot begins at the $u / s$ end of the $1^{\text {st }}$ Lambertson.

Misalignments (including BPM's)

- $\sigma(\Delta x, \Delta y)=0.25 \mathrm{~mm}$
- $\sigma\left(\psi_{\text {roll }}\right)=0.50 \mathrm{mr}$

Dipole Field Errors

- $\sigma(\Delta \mathrm{B} / \mathrm{B})=10 \mathrm{e}-4$
