# Introduction

The study of neutrino induced weak interactions is not only important to understand the analysis of the various oscillation experiments, but also it is important to understand the hadronic weak currents, estimation of atmospheric backgrounds for nucleon decay searches, strange quark content of the nucleon, etc.

The total  $\nu N$  CC scattering cross section

$$\sigma^{\text{TOTAL}} = \sigma^{\text{QEL}} \oplus \sigma^{\text{INEL}} \oplus \sigma^{\text{DIS}}$$

$$\sigma^{\text{INEL}} = \sigma^{1\pi} \oplus \sigma^{2\pi} \oplus \dots \oplus \sigma^{\text{YK}} \oplus \sigma^{1K} \oplus \dots \oplus \sigma^{1Y}$$

Exclusive  $\nu$ -N channels comprise 3 categories:

1. Single kaon production( $\Delta S=1$ )
2. Single hyperon production( $\Delta S=1$ )
3. Charged and neutral current induced associated particle production ( $\Delta S=0$ ).

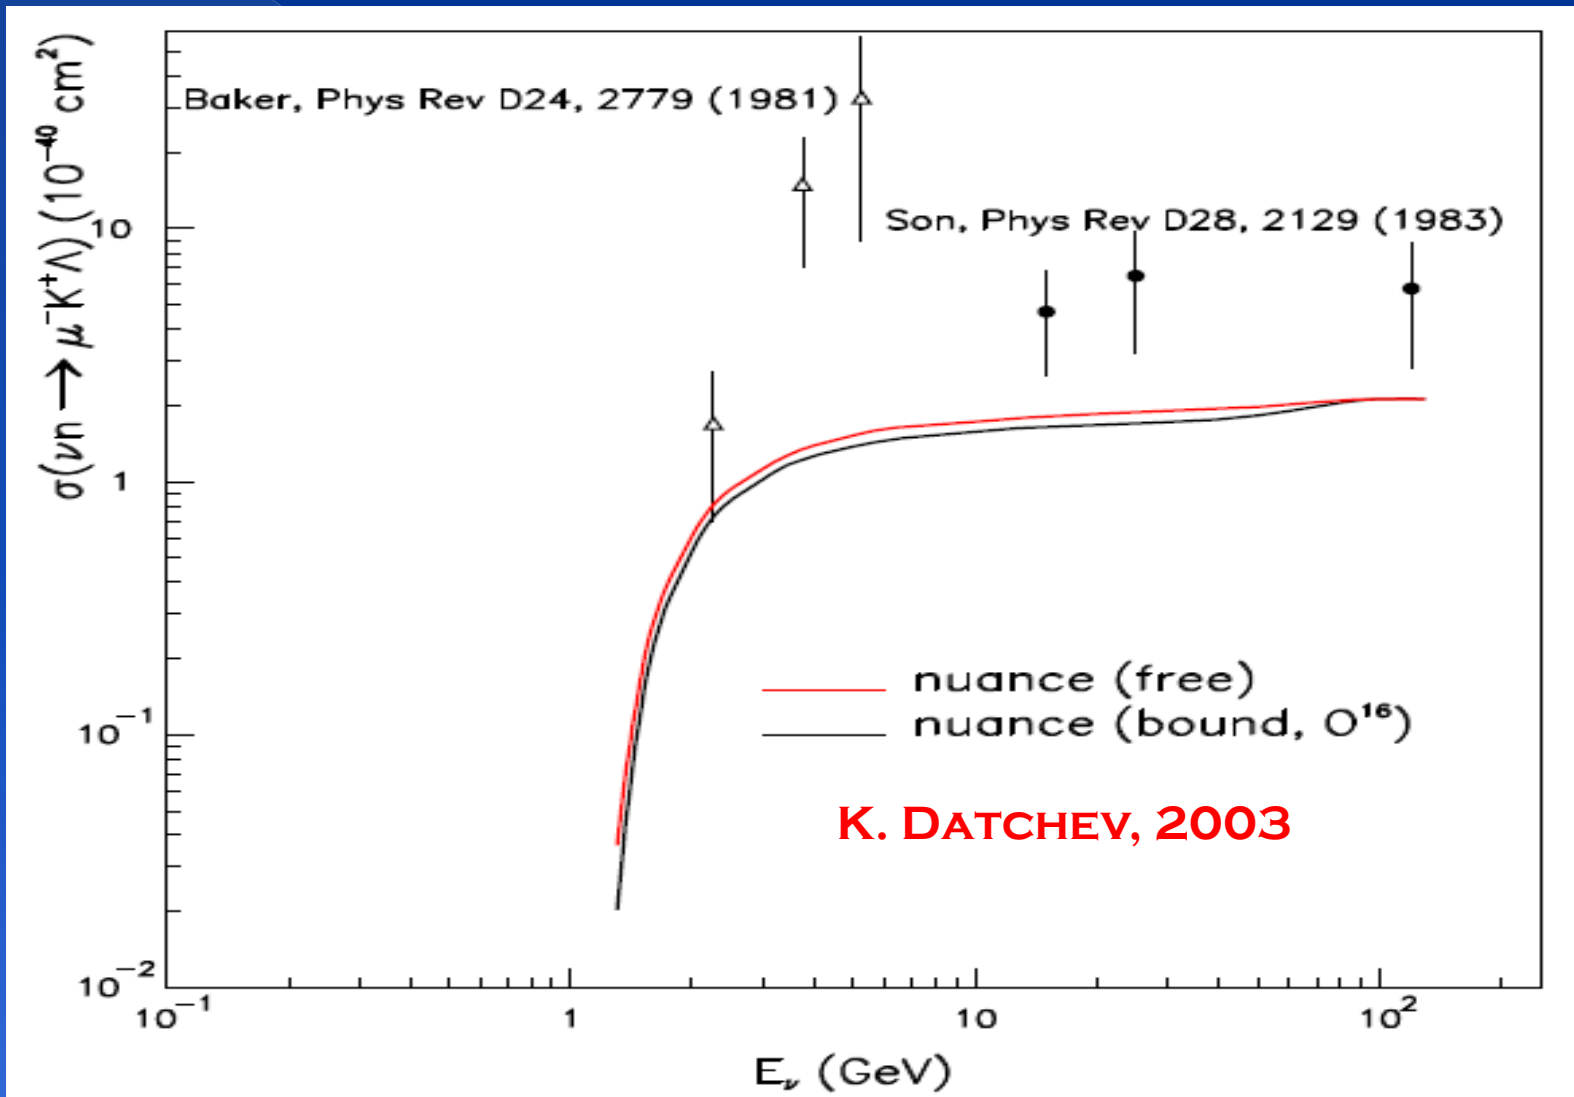

MINERvA is going to study strange particle production reactions . Their study would facilitate the understanding of the structure of hadronic weak current and the estimation of the atmospheric neutrino backgrounds for oscillation searches besides determining precisely  $\nu$ -A cross sections.

# Kaon Production at Minerva, 3 Tons and 4 Years

Reaction	Events(in Thousands)
$\Delta S=1$	Charged Current
$\nu_\mu + p \rightarrow \mu^- + K^+ + p$	16.0
$\nu_\mu + n \rightarrow \mu^- + K^0 + p$	2.5
$\nu_\mu + p \rightarrow \mu^- + K^{0n} + p$	2.0
$\Delta S=0$	Charged Current
$\nu_\mu + n \rightarrow \mu^- + K^+ + \Lambda^0$	10.5
$\nu_\mu + n \rightarrow \mu^- + K^+ + \Lambda^0 + \pi^0$	9.5
$\nu_\mu + n \rightarrow \mu^- + \pi^+ + \Lambda^0 + K^0$	6.5
$\nu_\mu + n \rightarrow \mu^- + \pi^+ + \Lambda^0 + K^0$	5.0
$\nu_\mu + n \rightarrow \mu^- + K^+ + K^- + p$	1.5
$\Delta S=0$	Neutral Current
$\nu_\mu + p \rightarrow \nu_\mu + K^+ + \Lambda^0$	3.5
$\nu_\mu + n \rightarrow \nu_\mu + K^0 + \Lambda^0$	1.0

Data Points with NUANCE Theoretical estimate for  $\nu_\mu + n \rightarrow \mu^- + K^+ + \Lambda^0$

MC includes only resonant kaon production based on RS models for pi prodn.

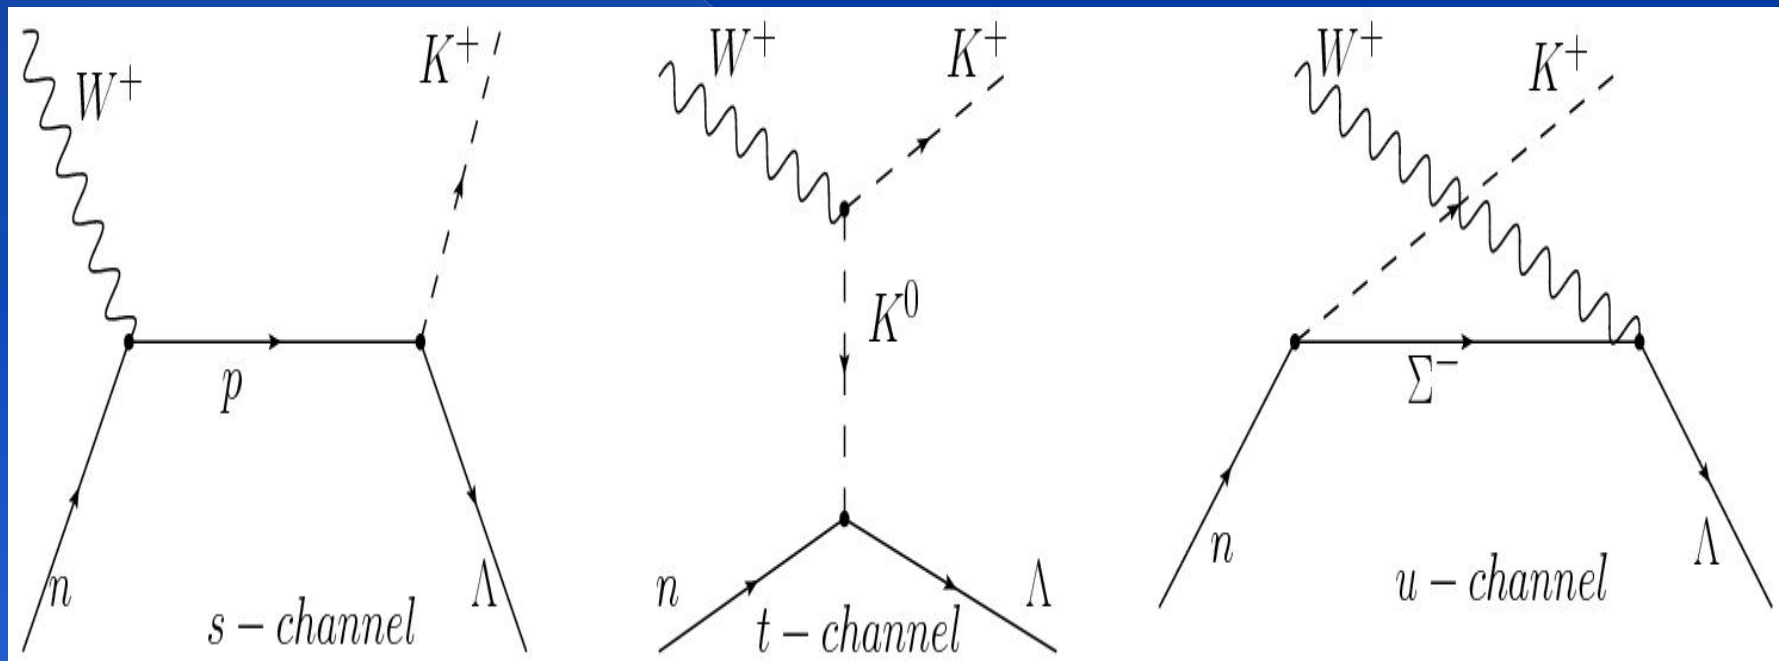

R. E. Shrock (Phys. Rev. D 12, 2049, 1975) used a resonant Born model and estimated the charged and neutral  $\nu_\mu + N \rightarrow \mu^- + K + \Lambda^0$  and  $\nu_\mu + N \rightarrow \mu^- + K^+ + \Sigma$  cross sections ( $\sim 10^{-40} \text{ cm}^2$ ) in the neutrino energy region up to 3 GeV.

A. A. Amer (Phys. Rev. D 18, 2290, 1978) used a harmonic oscillator quark model to estimate cross section for  $K^+ \Lambda$  production  $1.35 - 2.65 \sim 10^{-41} \text{ cm}^2$  which is almost an order of magnitude smaller than the measured result.

H. K. Dewan (Phys. Rev. D 24, 2369, 1981) has studied Associated Production as well as S.C. C.C. reactions  $\nu_\mu + N \rightarrow \mu^- + Y + \pi$  and  $\nu_\mu + N \rightarrow \mu^- + N + K$  using Born approximations with hyperon-nucleon transition form factors determined from the Cabibbo theory with SU(3) symmetry.

They have studied differential cross section for  $\nu$  induced C. C. Associated Particle Production using Born term approximation in the framework of Cabibbo theory and SU(3) symmetry.

Chiral perturbation theory (ChPT) is the effective field theory (EFT) of the Strong interactions at low energies.

➤ Here one writes a general Lagrangian, consisting of all terms allowed from the symmetry principles and then calculates the matrix elements with this Lagrangian to any given order of perturbation theory.

The lowest order SU(3) chiral Lagrangian describing the pseudoscalar mesons in the presence of an external current is given by:

S. Scherer----- Adv. Nucl. Phys. 27 (2003) 277

$$\mathcal{L}_M^{(2)} = \frac{f_\pi^2}{4} \text{Tr}[D_\mu U (D^\mu U)^\dagger] + \frac{f_\pi^2}{4} \text{Tr}(\chi U^\dagger + U \chi^\dagger),$$

$U$  is the  $SU(3)$  representation of meson fields

$$U(x) = \exp \left( i \frac{\phi(x)}{f_\pi} \right)$$

$$\phi(x) = \begin{pmatrix} \pi^0 + \frac{1}{\sqrt{3}}\eta & \sqrt{2}\pi^+ & \sqrt{2}K^+ \\ \sqrt{2}\pi^- & -\pi^0 + \frac{1}{\sqrt{3}}\eta & \sqrt{2}K^0 \\ \sqrt{2}K^- & \sqrt{2}\bar{K}^0 & -\frac{2}{\sqrt{3}}\eta \end{pmatrix},$$

The second term of the Lagrangian incorporates explicit breaking of chiral symmetry coming from the quark masses.

# Lowest order Chiral Lagrangian for the baryon octet in the presence of external current

$$\mathcal{L}_{MB}^{(1)} = \text{Tr} [\bar{B} (i\not{D} - M) B] - \frac{D}{2} \text{Tr} (\bar{B} \gamma^\mu \gamma_5 \{u_\mu, B\}) - \frac{F}{2} \text{Tr} (\bar{B} \gamma^\mu \gamma_5 [u_\mu, B]),$$

where  $D=0.804$ ,  $F=0.463$ ,  $B$  is the  $SU(3)$  Baryon Octet( $1/2^+$ ) field

$$B = \sum_{a=1}^8 \frac{\lambda_a B_a}{\sqrt{2}} = \begin{pmatrix} \frac{1}{\sqrt{2}}\Sigma^0 + \frac{1}{\sqrt{6}}\Lambda & \Sigma^+ & p \\ \Sigma^- & -\frac{1}{\sqrt{2}}\Sigma^0 + \frac{1}{\sqrt{6}}\Lambda & n \\ \Xi^- & \Xi^0 & -\frac{2}{\sqrt{6}}\Lambda \end{pmatrix}$$

where each entry is a Dirac field

# Single Kaon Production

PRD 82 (2010) 033001

$$\begin{aligned}\nu_l + p &\rightarrow l^- + K^+ + p \\ \nu_l + n &\rightarrow l^- + K^0 + p \\ \nu_l + n &\rightarrow l^- + K^+ + n\end{aligned}$$

PRD 85 (2012) 013014

$$\begin{aligned}\bar{\nu}_l + p &\rightarrow l^+ + K^- + p \\ \bar{\nu}_l + p &\rightarrow l^+ + \bar{K}^0 + n \\ \bar{\nu}_l + n &\rightarrow l^+ + K^- + n\end{aligned}$$

The basic reaction for the neutrino induced charged current kaon production is

$$\nu_l(k) + N(p) \rightarrow l^+(k') + K^-(p_k) + N(p')$$

for which the differential scattering cross section is given by

$$d^9\sigma = \frac{1}{4ME(2\pi)^5} \frac{d\vec{k}'}{(2E_l)} \frac{d\vec{p}'}{(2E'_p)} \frac{d\vec{p}_k}{(2E_K)} \delta^4(k+p-k'-p'-p_k) \bar{\Sigma}\Sigma |\mathcal{M}|^2,$$

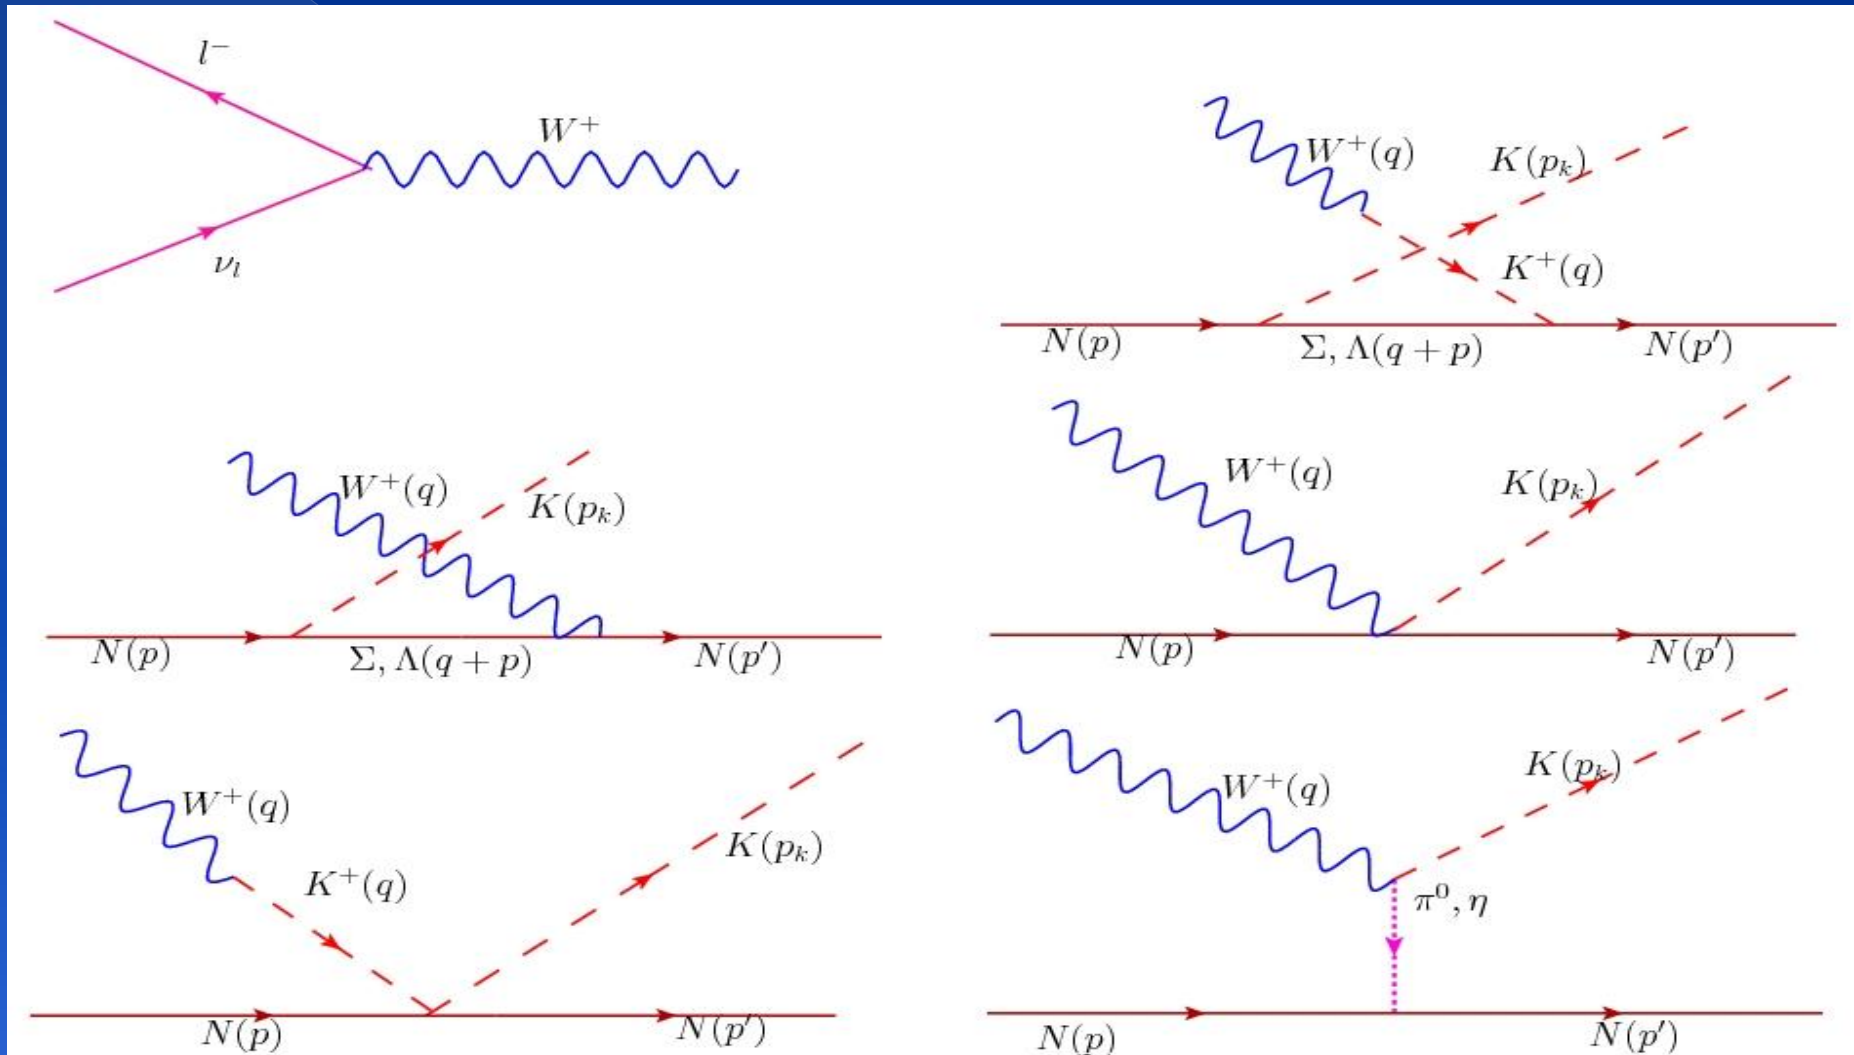

where  $M$  is the matrix element given by

$$\mathcal{M} = \frac{G_F}{\sqrt{2}} j_\mu^{(L)} J^{\mu(H)} = \frac{g}{2\sqrt{2}} j_\mu^{(L)} \frac{1}{M_W^2} \frac{g}{2\sqrt{2}} J^{\mu(H)},$$

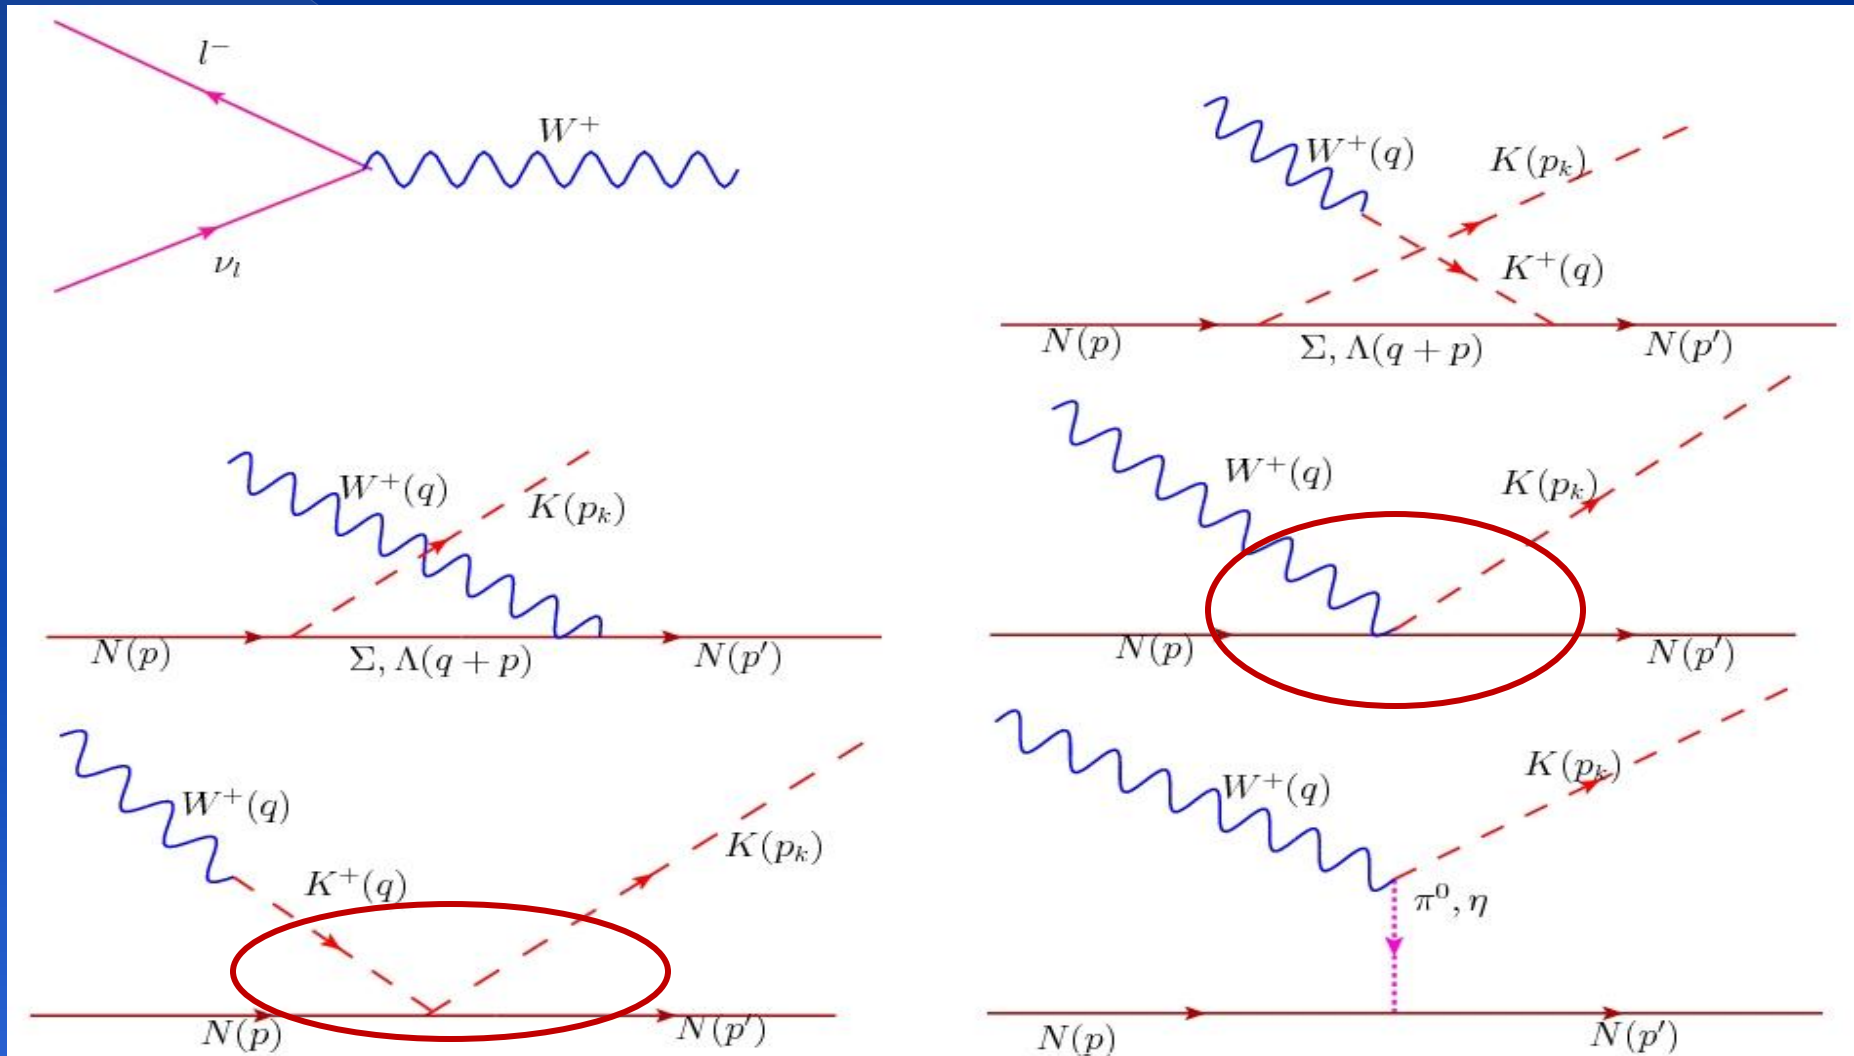

the leptonic current is given by,

$$\mathcal{L} = -\frac{g}{2\sqrt{2}} \left[ W_\mu^+ \bar{\nu}_l \gamma^\mu (1 - \gamma^5) l + W_\mu^- \bar{l} \gamma^\mu (1 - \gamma^5) \nu_l \right]$$

# Feynman diagrams for the neutrino induced process: u-channel Kaon in flight , u-channel, contact term, Kaon in flight, pion/eta in flight

*Feynman diagrams for the neutrino induced process: u-channel Kaon in flight , u-channel, contact term, Kaon in flight, pion/eta in flight*

# Contributions to the hadronic current for neutrino induced process

$$j^\mu|_{CT} = -iA_{CT}V_{us}\frac{\sqrt{2}}{2f_\pi}\bar{N}(p')(\gamma^\mu + \gamma^\mu\gamma^5 B_{CT})N(p),$$

$$j^\mu|_{Cr\Sigma} = iA_{Cr\Sigma}V_{us}\frac{\sqrt{2}}{2f_\pi}\bar{N}(p')\left(\gamma^\mu + i\frac{\mu_p + 2\mu_n}{2M}\sigma^{\mu\nu}q_\nu + (D - F)(\gamma^\mu - \frac{q^\mu}{q^2 - M_k^2}\not{q})\gamma^5\right) \\ \times \frac{\not{p} - \not{p}_k + M_\Sigma}{(p - p_k)^2 - M_\Sigma^2}\not{p}_k\gamma^5 N(p),$$

$$j^\mu|_{Cr\Lambda} = iA_{Cr\Lambda}V_{us}\frac{\sqrt{2}}{4f_\pi}\bar{N}(p')\left(\gamma^\mu + i\frac{\mu_p}{2M}\sigma^{\mu\nu}q_\nu - \frac{D + 3F}{3}(\gamma^\mu - \frac{q^\mu}{q^2 - M_k^2}\not{q})\gamma^5\right) \\ \times \frac{\not{p} - \not{p}_k + M_\Lambda}{(p - p_k)^2 - M_\Lambda^2}\not{p}_k\gamma^5 N(p),$$

$$j^\mu|_{KP} = iA_{KP}V_{us}\frac{\sqrt{2}}{4f_\pi}\bar{N}(p')(\not{q} + \not{p}_k)N(p)\frac{1}{q^2 - M_k^2}q^\mu,$$

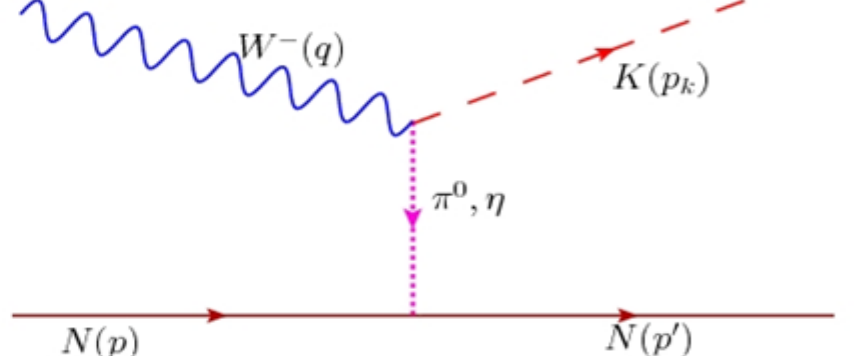

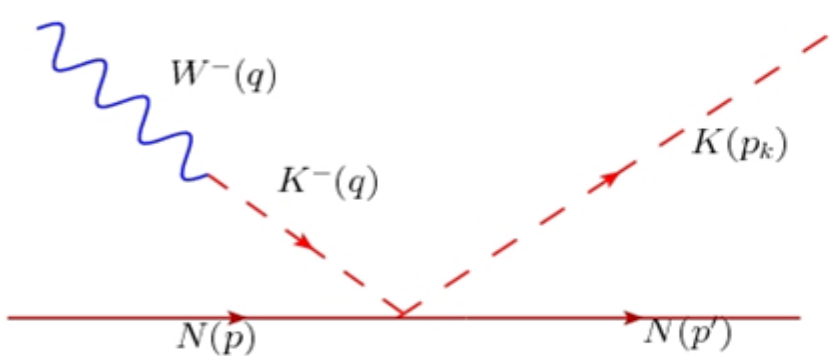

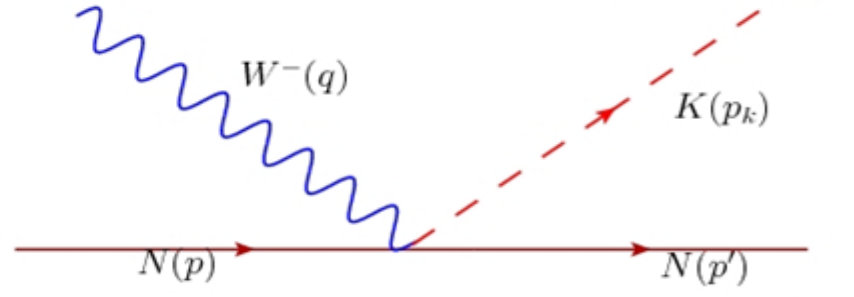

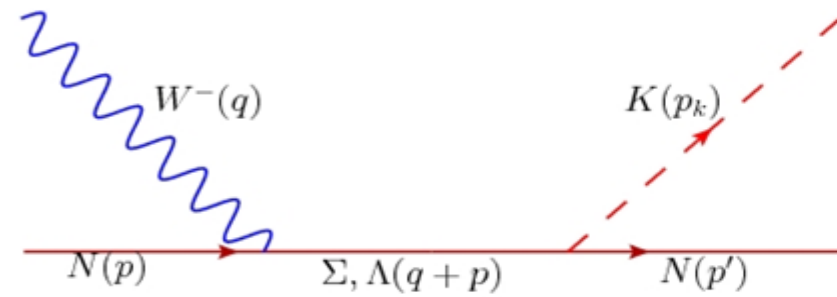

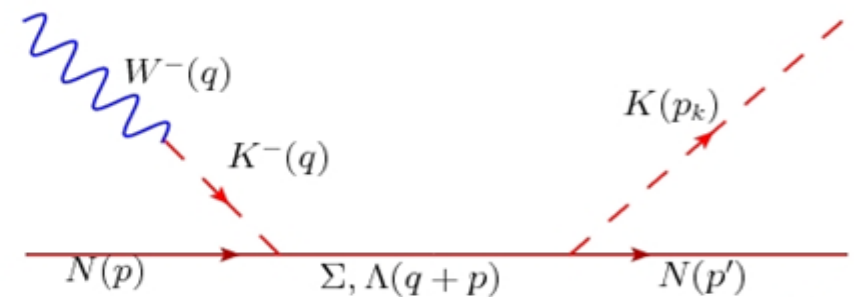

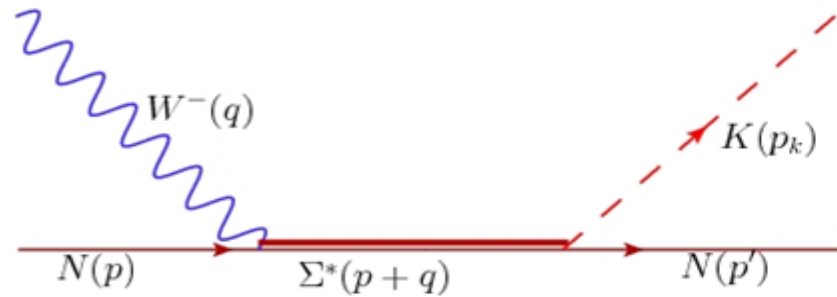

$$j^\mu|_\pi = iA_{\pi P}V_{us}(D + F)\frac{\sqrt{2}}{2f_\pi}\frac{M}{(q - p_k)^2 - M_\pi^2}\bar{N}(p')\gamma^5.(q^\mu - 2p_k^\mu)N(p),$$

$$j^\mu|_\eta = iA_{\eta P}V_{us}(D - 3F)\frac{\sqrt{2}}{2f_\pi}\frac{M}{(q - p_k)^2 - M_\eta^2}\bar{N}(p')\gamma^5.(q^\mu - 2p_k^\mu)N(p),$$

# Feynman diagrams for the anti-neutrino induced process: $\Sigma$ -resonance, s-channel Kaon in flight, s-channel, contact term, Kaon in flight, pion/eta in flight

The interaction between the baryon decuplet, the baryon octet and the meson octet is given by

$$\mathcal{L}_{dec} = \mathcal{C} \left( \epsilon^{abc} \bar{T}_{ade}^{\mu} u_{\mu,b}^d B_c^e + h.c. \right),$$

$T_{\mu}^{ade}$  is the  $SU(3)$  representation for the spin 3/2 decuplet field with the following associations:

$$\begin{aligned} T^{111} &= \Delta^{++}, & T^{112} &= \Delta^{+}/\sqrt{3}, & T^{122} &= \Delta^0/\sqrt{3}, & T^{222} &= \Delta^{-}, & T^{113} &= \Sigma^{*+}/\sqrt{3}, \\ T^{123} &= \Sigma^{*0}/\sqrt{6}, & T^{223} &= \Sigma^{*-}/\sqrt{3}, & T^{133} &= \Xi^{*0}/\sqrt{3}, & T^{233} &= \Xi^{*-}/\sqrt{3} & \text{and } T^{333} &= \Omega^{-} \end{aligned}$$

$\mathcal{C}$  is fitted from the  $\Delta^{++}$  decay and found to be  $= 0.996 \sim 1.0$

$$\begin{aligned} \langle \Sigma^{*}; P = p + q | V^{\mu} | N; p \rangle &= V_{us} \bar{\psi}_{\alpha}(\vec{P}) \Gamma_V^{\alpha\mu}(p, q) u(\vec{p}), \\ \langle \Sigma^{*}; P = p + q | A^{\mu} | N; p \rangle &= V_{us} \bar{\psi}_{\alpha}(\vec{p}) \Gamma_A^{\alpha\mu}(p, q) u(\vec{p}), \end{aligned}$$

$$j^{\mu} \propto p_k^{\alpha} \bar{N}(p') \mathcal{P}_{\alpha\beta} \Gamma^{\beta\mu}(p, q) N(p)$$

$$\begin{aligned} \Gamma_V^{\alpha\mu}(p, q) &= \left[ \frac{C_3^V}{M} (g^{\alpha\mu} \not{q} - q^{\alpha} \gamma^{\mu}) + \frac{C_4^V}{M^2} (g^{\alpha\mu} q \cdot P - q^{\alpha} P^{\mu}) + \frac{C_5^V}{M^2} (g^{\alpha\mu} q \cdot p - q^{\alpha} p^{\mu}) + C_6^V g^{\mu\alpha} \right] \gamma_5 \\ \Gamma_A^{\alpha\mu}(p, q) &= \left[ \frac{C_3^A}{M} (g^{\alpha\mu} \not{q} - q^{\alpha} \gamma^{\mu}) + \frac{C_4^A}{M^2} (g^{\alpha\mu} q \cdot P - q^{\alpha} P^{\mu}) + C_5^A g^{\alpha\mu} + \frac{C_6^A}{M^2} q^{\mu} q^{\alpha} \right] \end{aligned}$$

## Spin 3/2 Rarita-Schwinger projection operator

$$P^{\mu\nu}(P) = \sum_{spins} \psi^\mu \bar{\psi}^\nu = -(P + M_{\Sigma^*}) \left[ g^{\mu\nu} - \frac{1}{3} \gamma^\mu \gamma^\nu - \frac{2 P^\mu P^\nu}{3 M_{\Sigma^*}^2} + \frac{1}{3} \frac{P^\mu \gamma^\nu - P^\nu \gamma^\mu}{M_{\Sigma^*}} \right],$$

We take the P-wave width for the decay of  $\Sigma^* \rightarrow \Lambda\pi$  (87%)

$$\Gamma_{\Sigma^* \rightarrow Y, meson} = \frac{C_Y}{192\pi} \left( \frac{\mathcal{C}}{f_\pi} \right)^2 \frac{(W + M_Y)^2 - m^2}{W^5} \lambda^{3/2}(W^2, M_Y^2, m^2) \Theta(W - M_Y - m).$$

The factor  $C_Y$  is 1 for  $\Lambda$  and  $\frac{2}{3}$  for  $N$  and  $\Sigma$

And total width for  $\Sigma^*$  is :

$$\Gamma_{\Sigma^*} = \Gamma_{\Sigma^* \rightarrow \Lambda\pi} + \Gamma_{\Sigma^* \rightarrow \Sigma\pi} + \Gamma_{\Sigma^* \rightarrow N\bar{K}}$$

# Contributions to the hadronic current for anti-neutrino induced process

$$j_u^{\mu R} = i \frac{g_{\eta NS_{11}} V_{ud}}{f_\pi} \bar{u}_p(p') \tilde{\mathcal{J}}_R^\mu \gamma^5 \frac{\not{p} - \not{p}'_\eta + M_R}{(p-p_\eta)^2 - M_R^2 + i\Gamma_R M_R} u_n(p)$$

where

$$\mathcal{J}_N^\mu = f_1^V(Q^2) \gamma^\mu + f_2^V(Q^2) i \sigma^{\mu\rho} \frac{q_\rho}{2M_N} - (f^A(Q^2) \gamma^\mu + f^P(Q^2) q^\mu) \gamma^5$$

$$\mathcal{J}_R^\mu = \frac{F_1^V(Q^2)}{4M_N^2} (Q^2 \gamma^\mu + \not{q} q^\mu) + \frac{F_2^V(Q^2)}{2M_N} i \sigma^{\mu\rho} q_\rho - (F^A(Q^2) \gamma^\mu + F^P(Q^2) q^\mu) \gamma^5$$

$$\tilde{\mathcal{J}}^\mu = \gamma^0 \mathcal{J}^{\mu\dagger} \gamma^0$$

$f_{1,2}^V$  are isovector form factors for the nucleons which are expressed in terms of Dirac and Pauli form factors, which in turn are expressed in terms of electric and magnetic Sachs form factors. We have taken BBBA05 parametrisation.

$$f_1^V(Q^2) = f_1^p(Q^2) - f_1^n(Q^2); \quad f_2^V(Q^2) = f_2^p(Q^2) - f_2^n(Q^2)$$

$$f^A(Q^2) = \frac{f^A(0)}{(1 + \frac{Q^2}{M_A^2})^2}; \quad f^P(Q^2) = \frac{2M}{m_\pi^2 + Q^2} f^A(Q^2)$$

$$F_1^V(Q^2) = F_1^p(Q^2) - F_1^n(Q^2); \quad F_2^V(Q^2) = F_2^p(Q^2) - F_2^n(Q^2)$$

$$F^A(Q^2) = \frac{F^A(0)}{(1 + \frac{Q^2}{M_A^2})^2}; \quad F^P(Q^2) = \frac{M_R - M_N}{m_\pi^2 + Q^2} F^A(Q^2)$$

$$f^A(0) = 1.26, \quad F^A(0) = 2g_\pi^* \quad \text{where } g_\pi^* \sim 0.106$$

The total width is taken as

$$\Gamma_R(1535) = 0.42 \Gamma_{N^* \rightarrow N\eta} + 0.46 \Gamma_{N^* \rightarrow N\pi} + 0.12 \Gamma_{N^* \rightarrow X}$$

$$\Gamma_R(1650) = 0.10 \Gamma_{N^* \rightarrow N\eta} + 0.70 \Gamma_{N^* \rightarrow N\pi} + 0.20 \Gamma_{N^* \rightarrow X}$$

We have taken the following form for S-wave decay width

$$\Gamma_R(S11 \rightarrow Nm) = \frac{g_m^2 p_m^{CM}}{8\pi f_\pi^2} \frac{[(W^2 - M^2)^2 - m^2(2M_R^2 + M^2 - W^2 - 2MM_R)]}{W^2}$$

$$p_m^{CM} = \frac{\sqrt{\lambda(W^2, m^2, M_N^2)}}{2W}$$

For S11-1535,  $g_{\eta NS_{11}} = 0.286$  and for S11-1650,  $g_{\eta NS_{11}} = 0.0867$

$$A_{\frac{1}{2}}^{p,n} = \sqrt{\frac{2\pi\alpha}{M_N} \frac{(M_R + M_N)^2 + Q^2}{M_R^2 - M_N^2}} \left( \frac{Q^2}{4M_N^2} F_1^{p,n}(Q^2) + \frac{M_R - M_N}{2M_N} F_2^{p,n}(Q^2) \right)$$

$$S_{\frac{1}{2}}^{p,n} = \sqrt{\frac{\pi\alpha}{M_N} \frac{(M_R - M_N)^2 + Q^2}{M_R^2 - M_N^2}} \frac{(M_R - M_N)^2 + Q^2}{4M_R M_N} \left( \frac{M_R - M_N}{2M_N} F_1^{p,n}(Q^2) - F_2^{p,n}(Q^2) \right)$$

S11(1535)

$$A_{1/2}^p(Q^2) = 69.2 \times 10^{-3} (1. + 1.61364 Q^2) e^{-0.75879 Q^2},$$

$$S_{1/2}^p(Q^2) = -16.5 \times 10^{-3} (1. + 2.8261 Q^2) e^{-0.73735 Q^2},$$

$$A_{1/2}^n(Q^2) = -52.79 \times 10^{-3} (1. + 2.86297 Q^2) e^{-1.68723 Q^2},$$

$$S_{1/2}^n(Q^2) = 29.66 \times 10^{-3} (1. + 0.35874 Q^2) e^{-1.55 Q^2}$$

S11(1650)

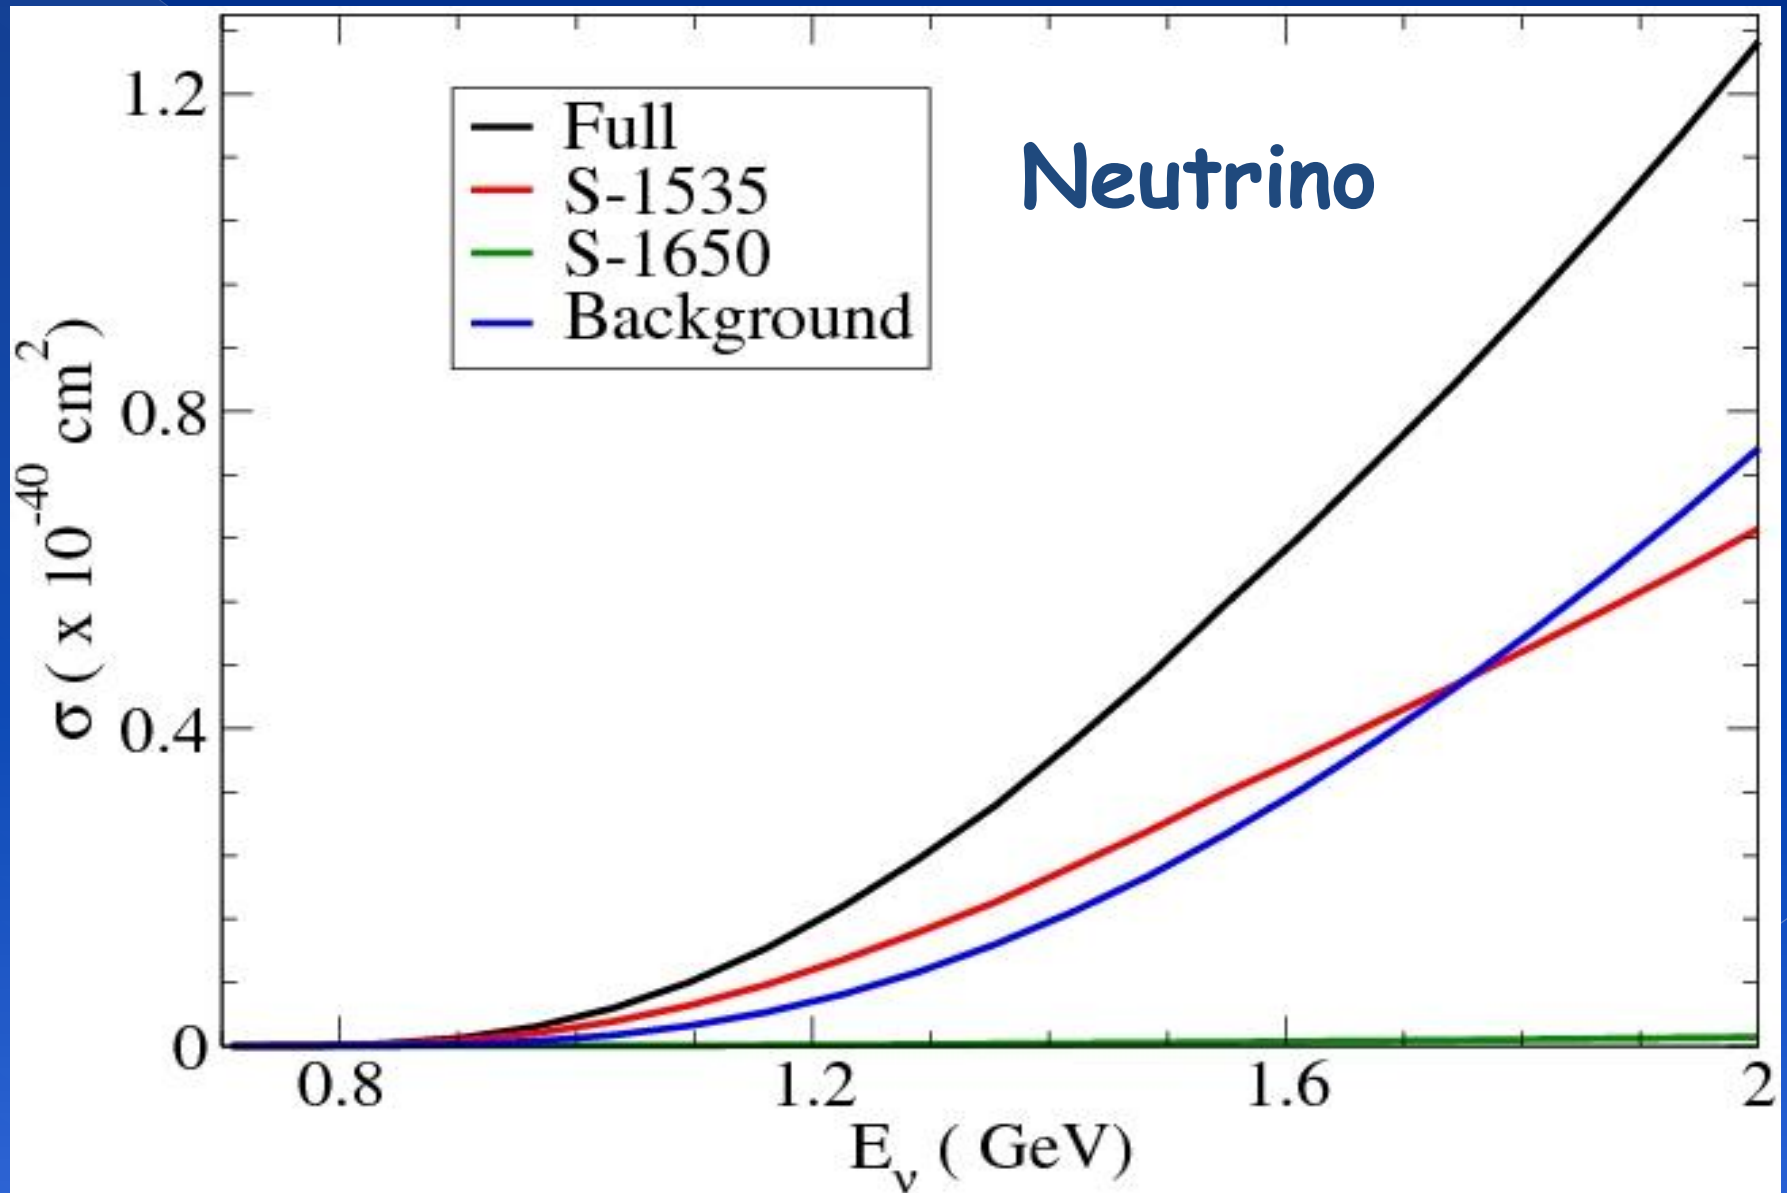

$$A_{1/2}^p(Q^2) = 33.3 \times 10^{-3} \times (1. + 1.45 Q^2) e^{0.62 Q^2},$$

$$S_{1/2}^p(Q^2) = -3.5 \times 10^{-3} \times (1. + 2.88 Q^2) e^{0.76 Q^2},$$

$$A_{1/2}^n(Q^2) = 9.3 \times 10^{-3} \times (1. + 0.13 Q^2) e^{1.55 Q^2},$$

$$S_{1/2}^n(Q^2) = 10.0 \times 10^{-3} \times (1. - 0.5 Q^2) e^{1.55 Q^2}$$

# Preliminary

# Conclusions

1. We have obtained cross sections for the single kaon production, eta production and associated particle production at the neutrino energies of 1-2 GeV.
2. We find the contribution of contact term to be significant in single kaon production as well as in the associated particle production.
3. Contribution of  $S_{11}(1535)$  resonance to neutrino induced eta production is not dominant one, unlike the electromagnetic interactions.
4. Results of the associated particle production also require the contribution of resonant channels, which we are planning to include.

THANK  
YOU!

$D_\mu U$  is covariant derivative given as,

$$D_\mu U \equiv \partial_\mu U - ir_\mu U + iUl_\mu$$

with  $l_\mu$  and  $r_\mu$  as left and right handed external currents.

For the charged current case,

$$r_\mu = 0, \quad l_\mu = -\frac{g}{\sqrt{2}}(W_\mu^+ T_+ + W_\mu^- T_-),$$

$g$  is the weak gauge coupling related with Fermi coupling constant  $G_F$  as,

$$G_F = \sqrt{2} \frac{g^2}{8M_W^2} = 1.16639(1) \times 10^{-5} \text{ GeV}^{-2}$$

$$T_+ = \begin{pmatrix} 0 & V_{ud} & V_{us} \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{pmatrix} ; \quad T_- = \begin{pmatrix} 0 & 0 & 0 \\ V_{ud} & 0 & 0 \\ V_{us} & 0 & 0 \end{pmatrix} .$$

$V_{ij}$  denote the elements of the CKM quark mixing matrix describing the transformation between the mass eigen states of the QCD and the weak eigen states.

$$|V_{ud}| = 0.9735 \pm 0.0008 \text{ and } |V_{us}| = 0.2196 \pm 0.0023$$
