The Muon Program

Adam L. Lyon (Scientific Computing Division)

Fermilab 2015 Institutional Review

10-13 February 2015

Overview

- Motivation and P5

- The experiments

- Bringing the lab together

The Muon program is a high priority in P5

Building for Discovery

Strategic Plan for U.S. Particle Physics in the Global Context

Report of the Particle Physics Project Prioritization Panel (P5)

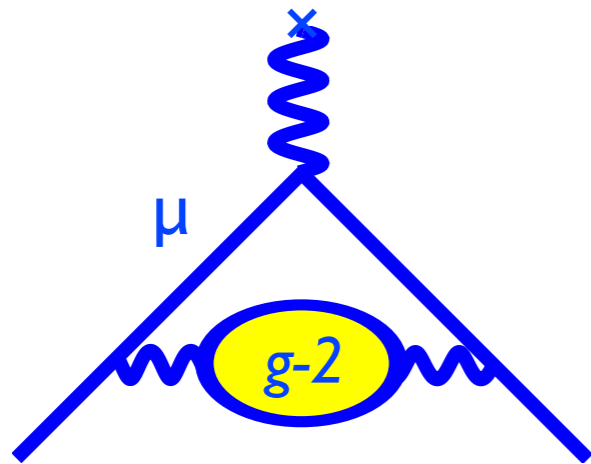

May 2014

- Use the Higgs boson as a new tool for discovery
- Pursue the physics associated with neutrino mass
- Identify the new physics of dark matter
- Understand cosmic acceleration: dark energy and inflation
- Explore the unknown: new particles, interactions, and physical principles.

Project/Activity	Scenarios			Science Drivers					Technique (Frontier)
	Scenario A	Scenario B	Scenario C	Higgs	Neutrinos	Dark Matter	Cosm. Accel.	The Unknown	
Large Projects									
Muon program: Mu2e, Muon g-2	Y, Mu2e small reprofile needed	Y	Y					✓	I
HL-LHC	Y	Y	Y	✓		✓		✓	E
LBNF + PIP-II	Y, LBNF components delayed relative to Scenario B.	Y	Y, enhanced		✓			✓	I,C
ILC	R&D only	R&D, possibly small hardware contributions. See text.	Y	✓		✓		✓	E

Indirect searches offer opportunities for discoveries

The Fermilab Muon Program

Muons offer exciting prospects for discovery

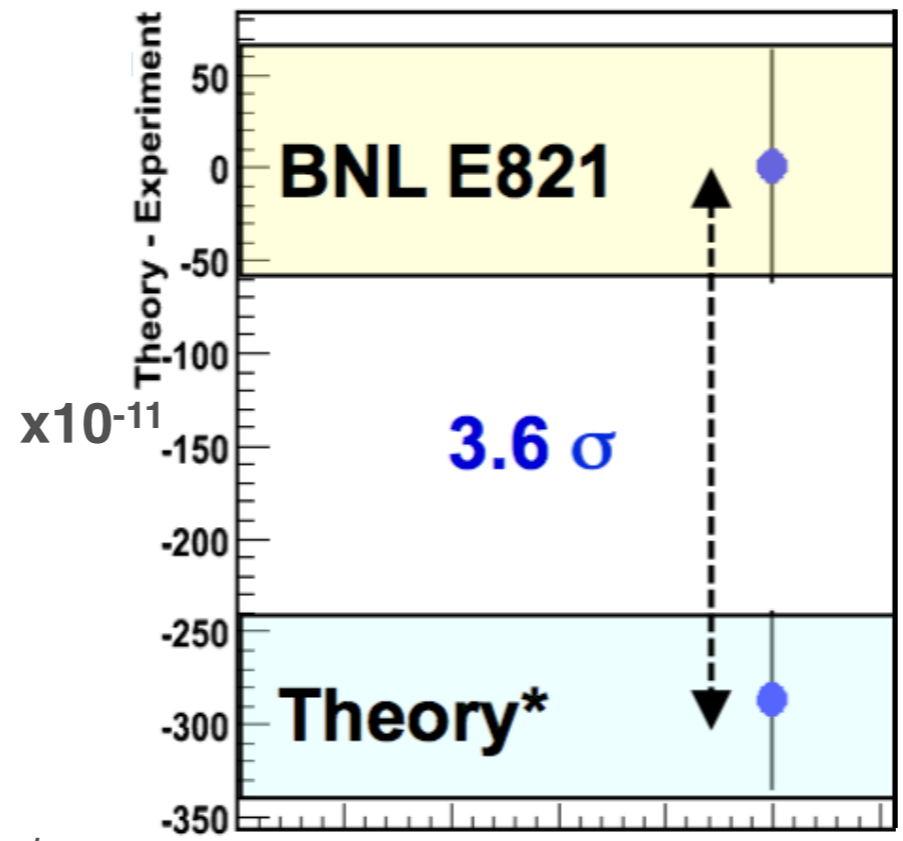

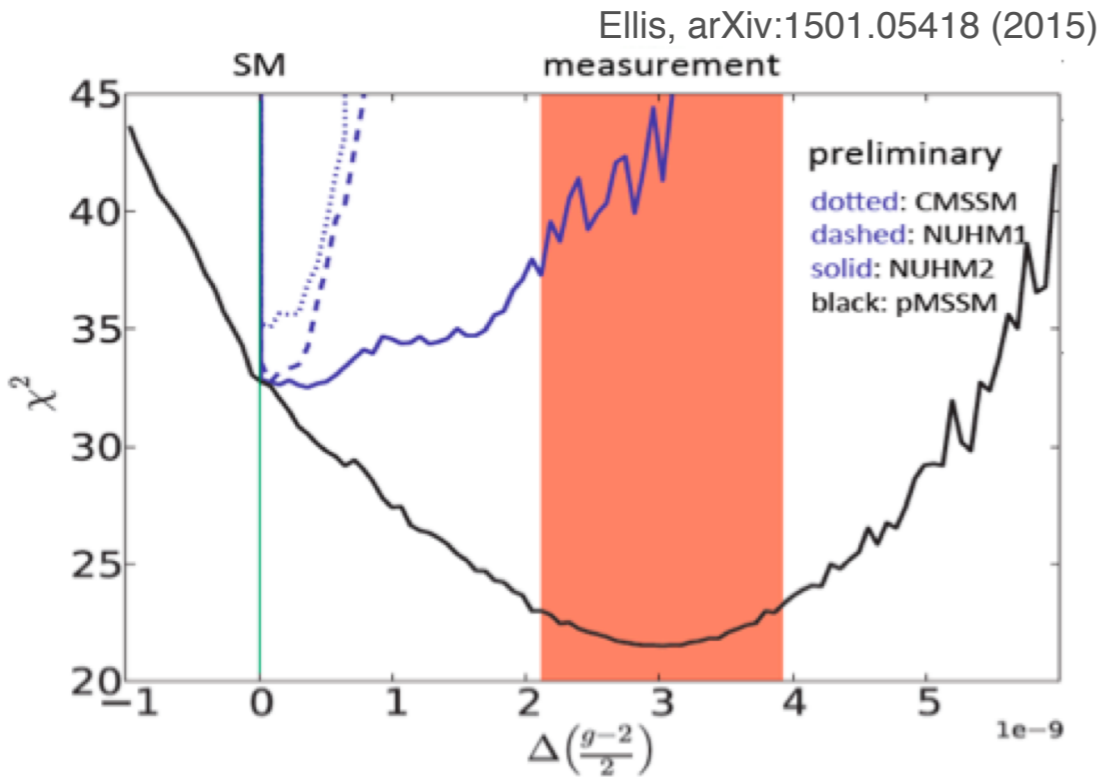

Muon $g-2$ probes TeV scale (flavor conserving) physics with the muon anomalous magnetic moment

Mu2e probes effective mass scales of $10^3 - 10^4$ TeV range with charged lepton flavor violation

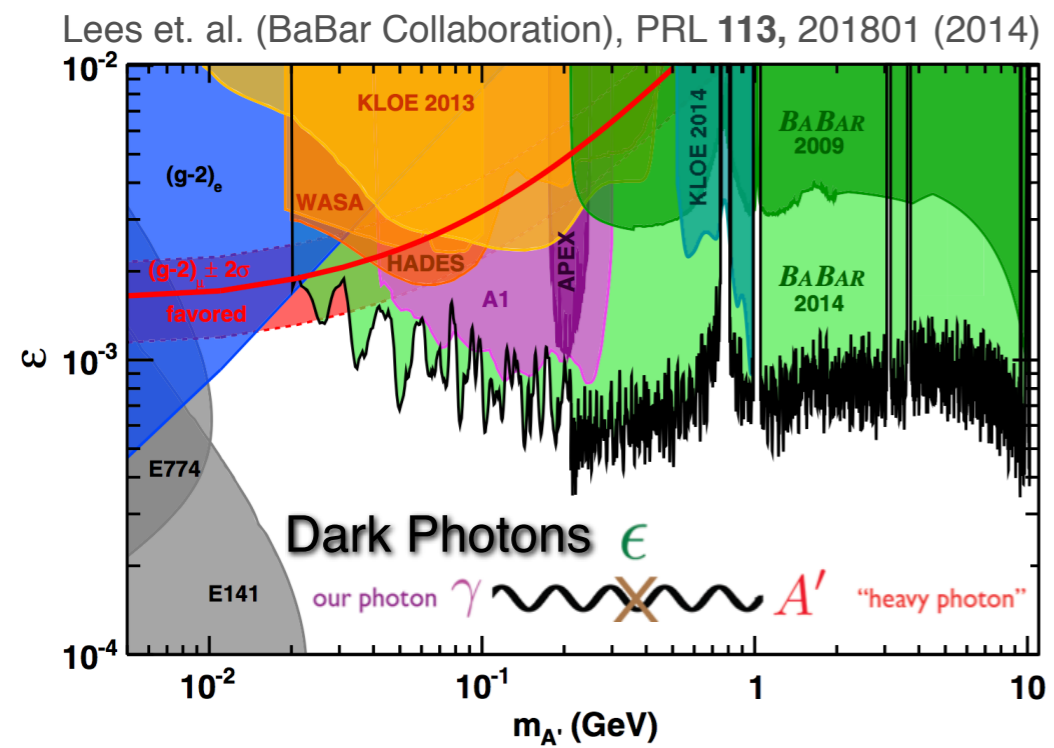

Fermilab supports these experiments with common facilities, infrastructure, and technical and scientific leadership

The Muon $g-2$ is a unique probe for new physics

*See Snowmass White Paper arXiv:1311.2198 [hep-ph]

Chirality-flipping while CP and flavor conserving, unlike many other low energy observables

Sensitive to SUSY sleptons and $\text{sign}(\mu)$, dark matter models

A hint of new physics?!?!?
Complementary to LHC's direct searches

See Polly talk [Project] in Breakout 1D; Kiburg talk [Highlights] in Breakout 6B

The Muon $g-2$ measurement

μ^+ are stored in the ring and decay to positrons, which travel inward hitting detectors

Highest energy positrons are emitted in direction of muon spin

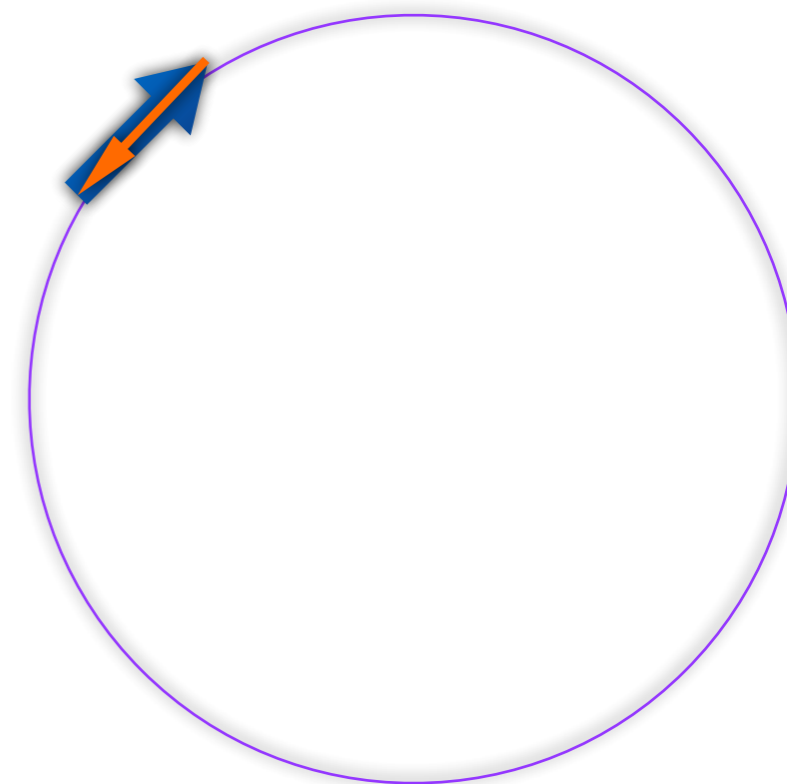

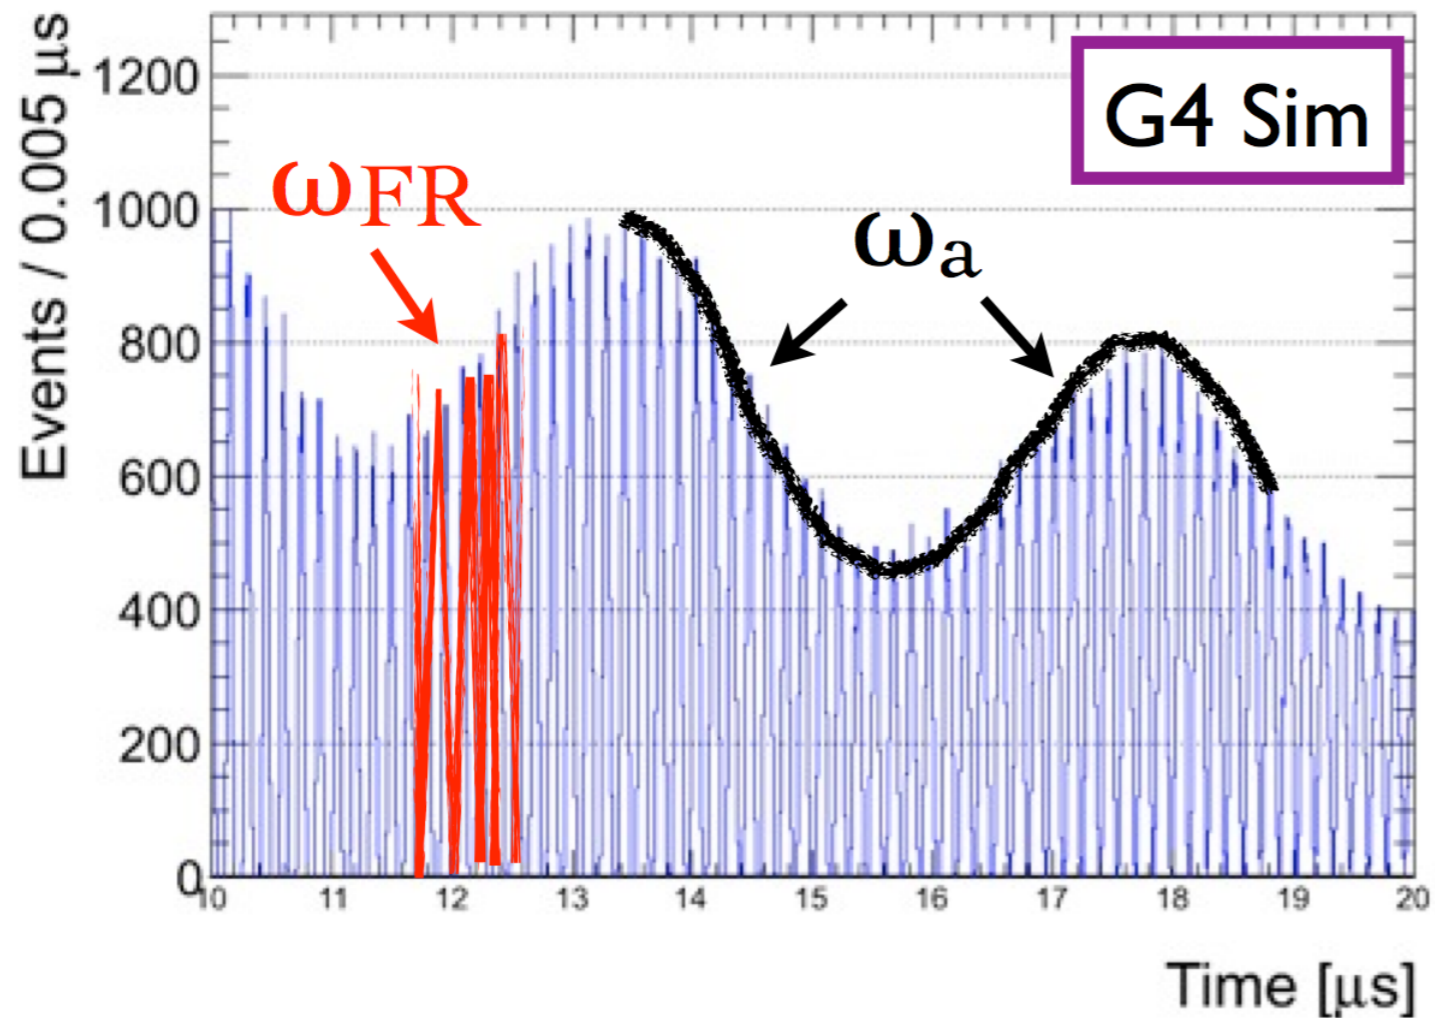

Boost to the lab frame gives E a boost

The Muon $g-2$ measurement

Maximum E oscillates at ω_a

From Lawrence Gibbons

A uniform magnetic field is crucial

$$\omega_a = a_\mu \frac{eB}{m_\mu c}$$

$$a_\mu = \frac{g_e}{2} \frac{\omega_a}{\omega_p} \frac{\mu_p}{\mu_e} \frac{m_\mu}{m_e}$$

ω_p is free proton precession frequency (free proton spin rotation rate in ring)

Measure magnetic field in storage region with fixed NMR probes and trolley

Straw trackers are important for measuring beam profile and for systematics

An exciting result - but not a discovery

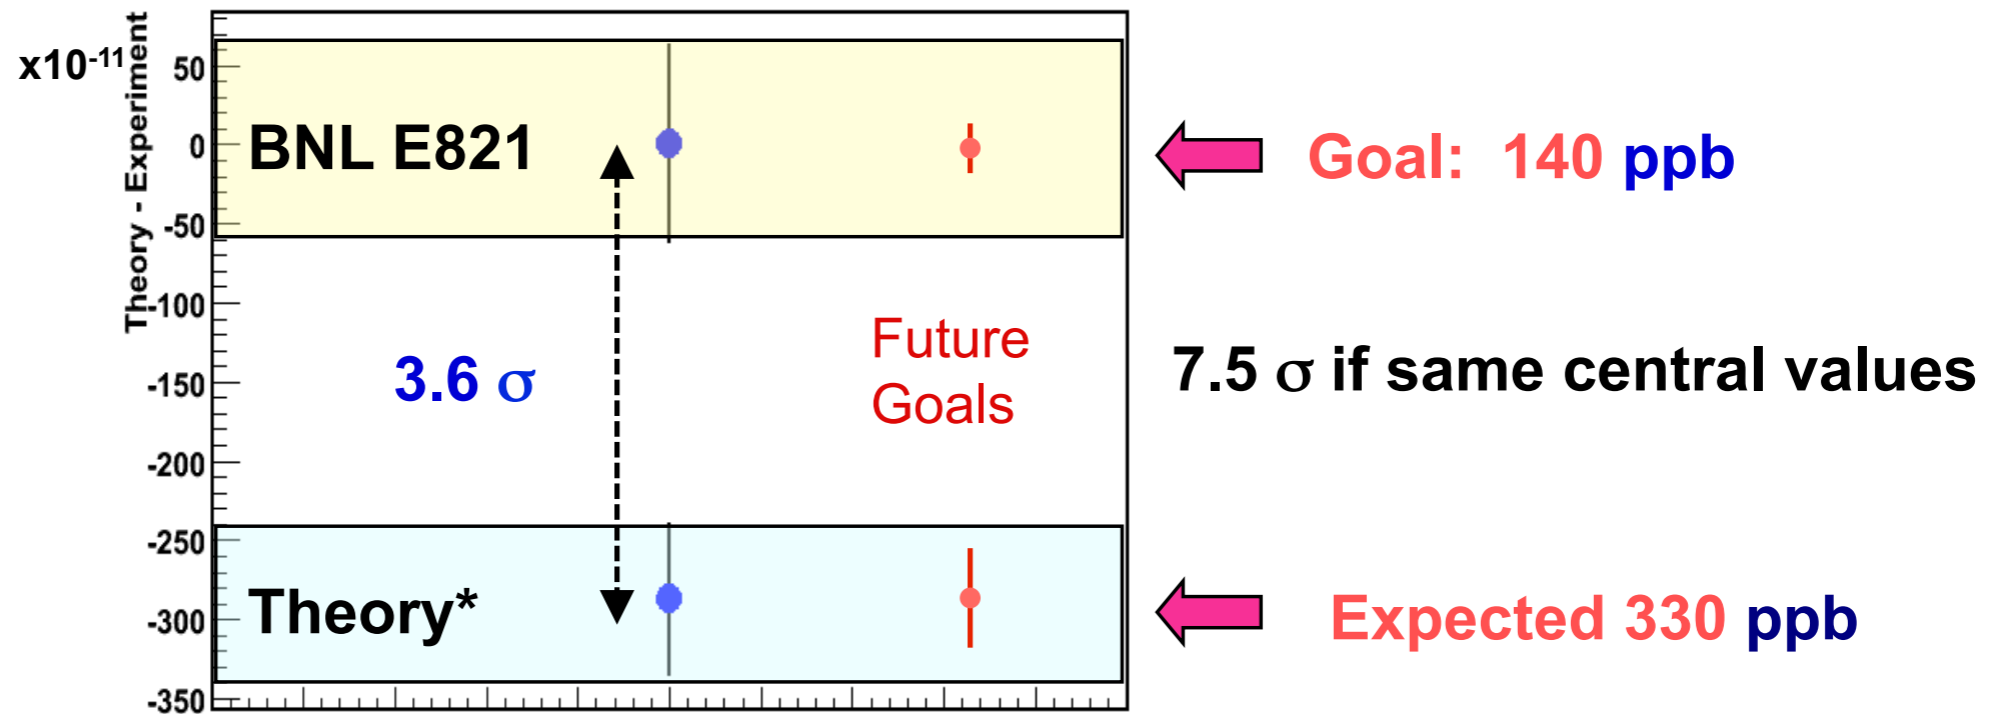

$$a_{\mu}^{\text{exp}} = 116\,592\,089(63) \times 10^{-11} \quad (0.54 \text{ ppm})$$

Year 2000 data
4B decays
5 parameter fit

Running at Fermilab, with more 20x statistics and improved systematics, for the definitive $g-2$ experiment

Getting from 540 ppb to 140 ppb...

E989 Experimental Scope

Positive muons will be used to measure the muon anomaly to an absolute precision of $\delta a_\mu = 16 \times 10^{-11}$ (140 ppb). The error budget is distributed as follows:

<u>Category</u>	<u>Error (ppb)</u>	<u>vs BNL E821</u>
Statistical	100	x20 events
Field Systematics	70	x2 better
Precession Systematics	70	x3 better

*See Snowmass White Paper arXiv:1311.2198 [hep-ph]

February 8, 2015

New detectors: Calorimeters and Straws

- Calorimeters 24 9x6 PbF2 crystal arrays with SiPM readout
- New electronics and DAQ
- 3x 1024 channel straw trackers to precisely monitor properties of stored muon beam via tracking of Michel decay positrons
- Auxiliary detectors

Calorimeters; SLAC Test Beam

Additional funding sources

- **NSF MRI, INFN:** Calorimeters, DAQ and electronics
- **DOE Early Career, STFC:** Straw Tracker
- **IF Fellowships**
- **URA Visiting Scholar Fellowships**
- **DOE Office of Science Graduate Student Research Awards**

Straw Trackers; Fermilab (PPD) Test Beam

Muon $g-2$ highlights of 2014

MC-1 Completed and Ring arrives!
Test beam for calorimeter at SLAC
Test beam for tracker at FNAL
TDR Complete and CD-2/3 review

2015 –

March: Cool down and test magnet
July: Test beam for tracker at FNAL
July: Analysis Workshop at U. Washington
Ongoing: Ring reassembly, shimming

Plan is first muons in early 2017!

Muon $g-2$ Technical Design Report

July, 2014

Fermi National Accelerator Laboratory
Batavia, IL 60510

www.fnal.gov

Managed by

Fermi Research Alliance, FRA

For the United States Department of Energy under
Contract No. DE-AC02-07-CH-11359

Contacts: C. Polly – Project Manager (polly@fnal.gov)

D. Hertzog – Co-Spokesperson (hertzog@uw.edu)
B. L. Roberts – Co-Spokesperson (roberts@bu.edu)

The Mu2e Experiment

Neutral lepton flavor violation happens (a whole cross-cut devoted to that!)

Charged Lepton Flavor Violation (CLFV):

Suppressed in SM to $< 10^{-50}$

But, BSM models may contribute at level just out of reach of current experiments

A signal is a clear sign of new physics!

See Ray talk [Project] in Breakout 1D; Knoepfel talk [Highlights] in Breakout 6B

What is measured in Mu2e?

Ratio of CLFV conversions to number of captures:

$$R_{\mu e} = \frac{\Gamma[\mu^- + A(Z, N) \rightarrow e^- + A(Z, N)] \quad \text{(BSM)}}{\Gamma[\mu^- + A(Z, N) \rightarrow \nu_\mu + A(Z - 1, N)] \quad \text{(SM)}}$$

Mu2e goals for $R_{\mu e}$

- Single-event-sensitivity: 2.5×10^{-17}
- Upper limit 90% C.L. 6×10^{-17} Need $> 10^{18}$ muons
- Probing mass scales $10^3 - 10^4$ TeV
- Background goal < 1 event

- Previous best limits

$$R_{\mu e} < 7 \times 10^{-13} \quad \text{SINDRUM-II 2006}$$

$$Br(\mu \rightarrow e\gamma) < 5.7 \times 10^{-13} \quad \text{MEG 2013}$$

$$Br(\mu \rightarrow 3e) < 1 \times 10^{-12} \quad \text{SINDRUM-I 1988}$$

Mu2e is factor of
 $\sim 10^4$ more sensitive

How does Mu2e measure R ?

Generate low momentum muons from 8 GeV proton beam

Stop muons to orbit around an Al nucleus

Time constant for muons bound to Al nucleus = 864 ns

Electrons spiral into tracker and calorimeter

$$\begin{aligned} E_e &= m_\mu c^2 - E_b - E_{\text{recoil}} \\ &= 104.973 \text{ GeV} \quad (\text{for Al}) \end{aligned}$$

Signal is excess at endpoint of rapidly falling continuous spectrum

Proton timing is crucial

Plan on beam commissioning in late 2020; 3 year run

- Background task force
Simulated 100B events!
FNAL, Novosibirsk, Virginia, LBNL, UC Irvine
- Geant4 Geometry

FNAL California Institute of Technology U. Virginia U. Louisville
LBNL Northern Illinois University UC, Irvine Boston University

The Muon Campus optimizes the global muon program

Minimizes cost, meets combined needs of experiments, accommodates build time scales, versatile, creates options for future experiments

Common solutions and shared infrastructure saved ~\$100M compared to each experiment making its own solution

See Convery talk in Breakout 1D

Muon campus is shared infrastructure and funding (Accelerator Division)

Optimized plan presented to OHEP in Jan 2012 by Annala, Glenzinski, Polly, and Ray

Common upgrades managed as AIP/GPP packages in order to meet the combined specs and timelines of both expts.

Managed by Mary Convery who is also the L2 for the accelerator g-2 work.

Beam Transport AIP:
New connection from Recycler to Delivery Ring, improve apertures

MC-1 Building GPP:
Houses cryo plant, power supplies for beams, g-2

Cryo Plant AIP:
Cryogenics to both experimental halls

Recycler RF AIP:
Adds RF capability to Recycler meeting g-2/Mu2e specifications

Delivery Ring AIP:
Modify Delivery Ring to deliver custom beams to the muon experiments

Beamline Enclosure GPP:
New tunnel to Muon Campus

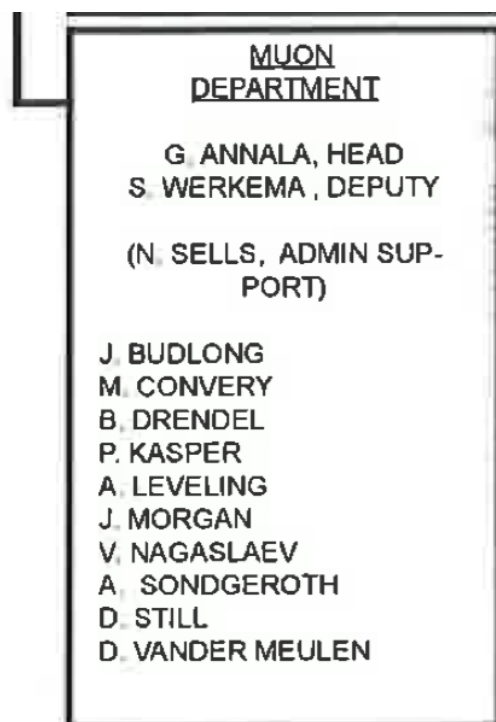

Infrastructure Upgrades GPP:
Cooling for A0 compressors, MI-52 building extension, added feeder if needed

Holes in the ground == Progress

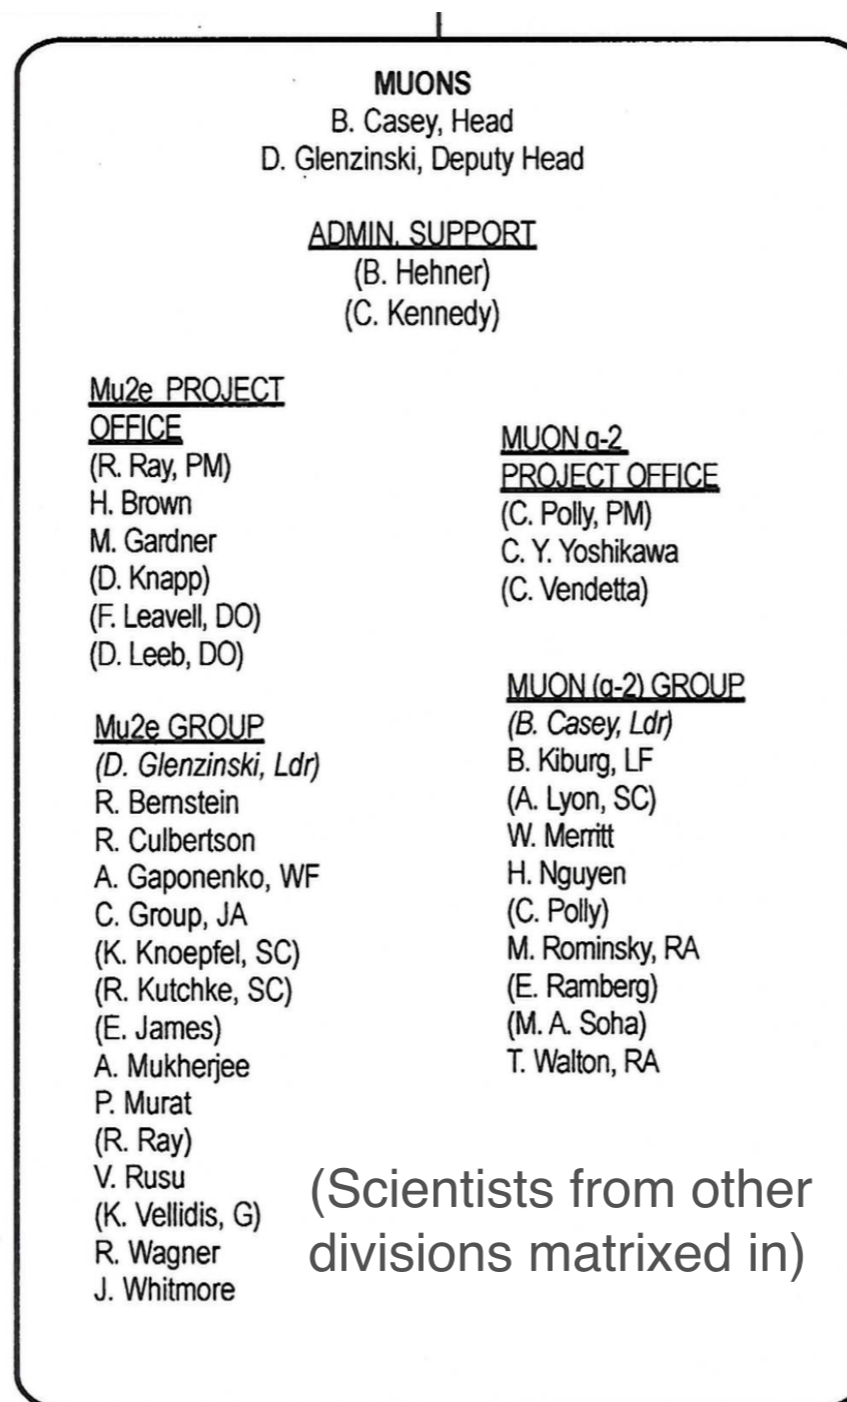

Organized to bring muon expertise together

Muon department in AD

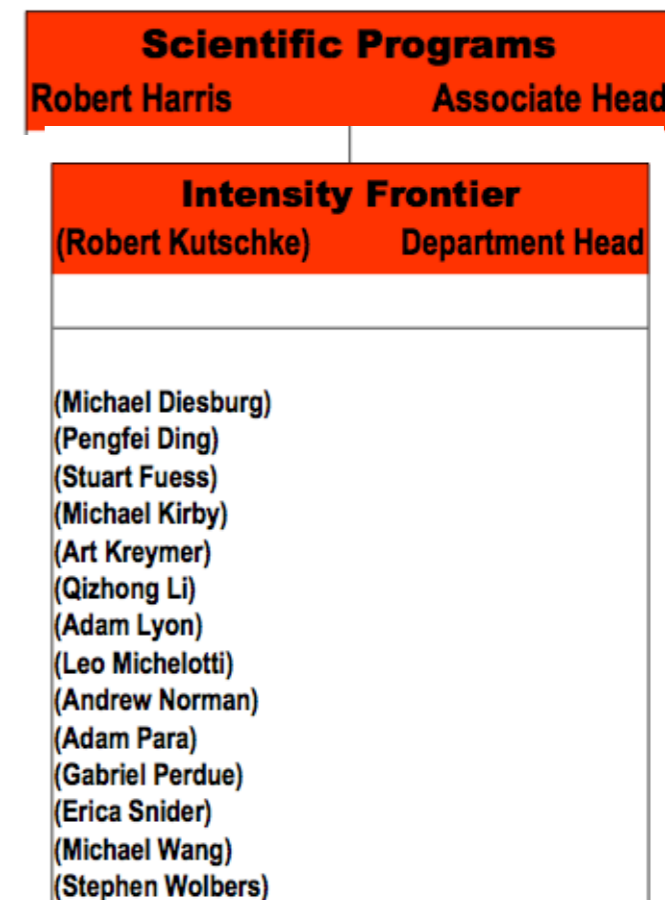

Muons department in PPD

Scientific Programs in SCD

Division is organized in **functional** departments, with scientists matrixed into a cross-cutting Scientific Programs Quadrant

Both Mu2e and *g-2* benefit from TD's expertise

Mu2e *production [PS]* and *detector [DS]* solenoids built by industry from reference designs

Transport solenoid (S-curved) [TS] is collaboration between Fermilab TD, INFN Genova, Industry

Prototype TS coil module delivered January 2015 (need 27 modules total)

	PS	TS	DS
Length (m)	4	13	11
Diameter (m)	1.7	0.8	1.9
Field @ start (T)	4.6	2.5	2.0
Field @ end (T)	2.5	2.0	1.0
Number of coils	3	52	11
Conductor (km)	10	44	15
Operating current (kA)	10	3	6
Stored energy (MJ)	80	20	30
Cold mass (tons)	11	26	8

Both Mu2e and *g-2* benefit from TD's expertise

How do muons enter a continuous magnet?

Inflector cancels fringe field near injection region so muons are not deflected

Superconducting shield upgrade under study by TD

- Construction of the multilayer NbTi shield is very unique
- Production technology may no longer exist
- TD is studying the shield for feasibility

TD "Teslatron" for shield testing

100 μm thick, 46' long, 10" wide NbTi foil purchased this year from Luvata

1995 Spare *g-2* shield material

SCD Common Software, Tools and Services are used broadly

Application software frameworks help Physicists be efficient and effective; infrastructure is critical

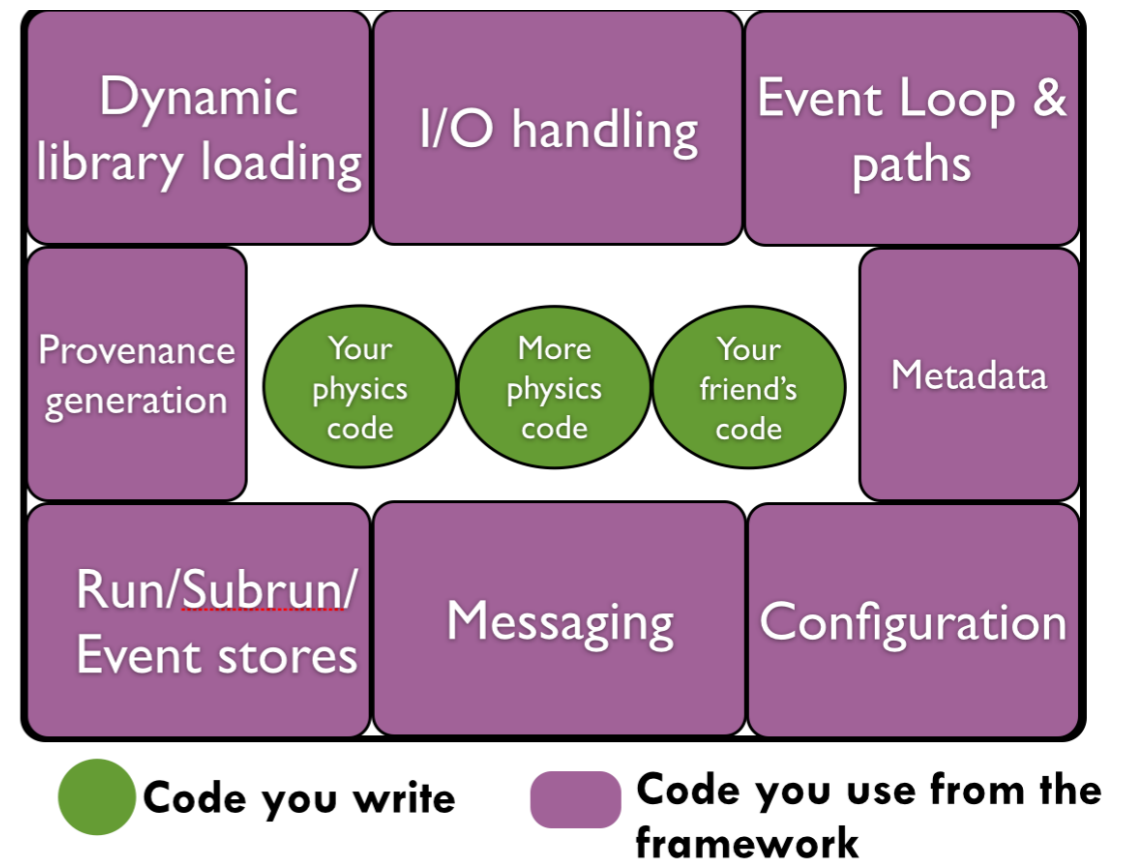

A framework surrounds physics code with infrastructure services

Mu2e instigated the “art” framework

Forked from CMSSW and tailored for neutrino/muon experiments

Used by Mu2e, Muon $g-2$, NOvA, MicroBoone, LArIAT, LBNF, Darkside-50

See Spentzouris Plenary Talk and Roser talk in Breakout 2C

Experiments use art as-is as an external

New features and direction decided among stakeholders by consensus

SCD is working to identify common functionality, principles, and goals between *CMSSW* and *art* to leverage new architectures, tools, and effort for the future

There are many benefits to having a shared framework

Main support team is from SCD, but computing experts from experiments help answer questions

Experiments help each other with common computing problems and can easily share their solutions

(“Hey NOvA, how did you do ...?”)

Advances to the framework (event mixing, multithreading, ease of use), benefit many experiments simultaneously

Common training (classes & workshops) and documentation (art-workbook) benefit many experiments

FNAL Software School 2014

Mu2e will use SCD's "artdaq" for online/offline integration

artdaq is a toolkit for creating DAQ systems

Provides common reusable components. Based on event streaming architecture with software event filtering

Integrated with art framework, so offline modules can run online

Used by Darkside-50 [first production use], LBNE (35t), **Mu2e** [pilot system under development], LArIAT [used on top of original DAQ code]

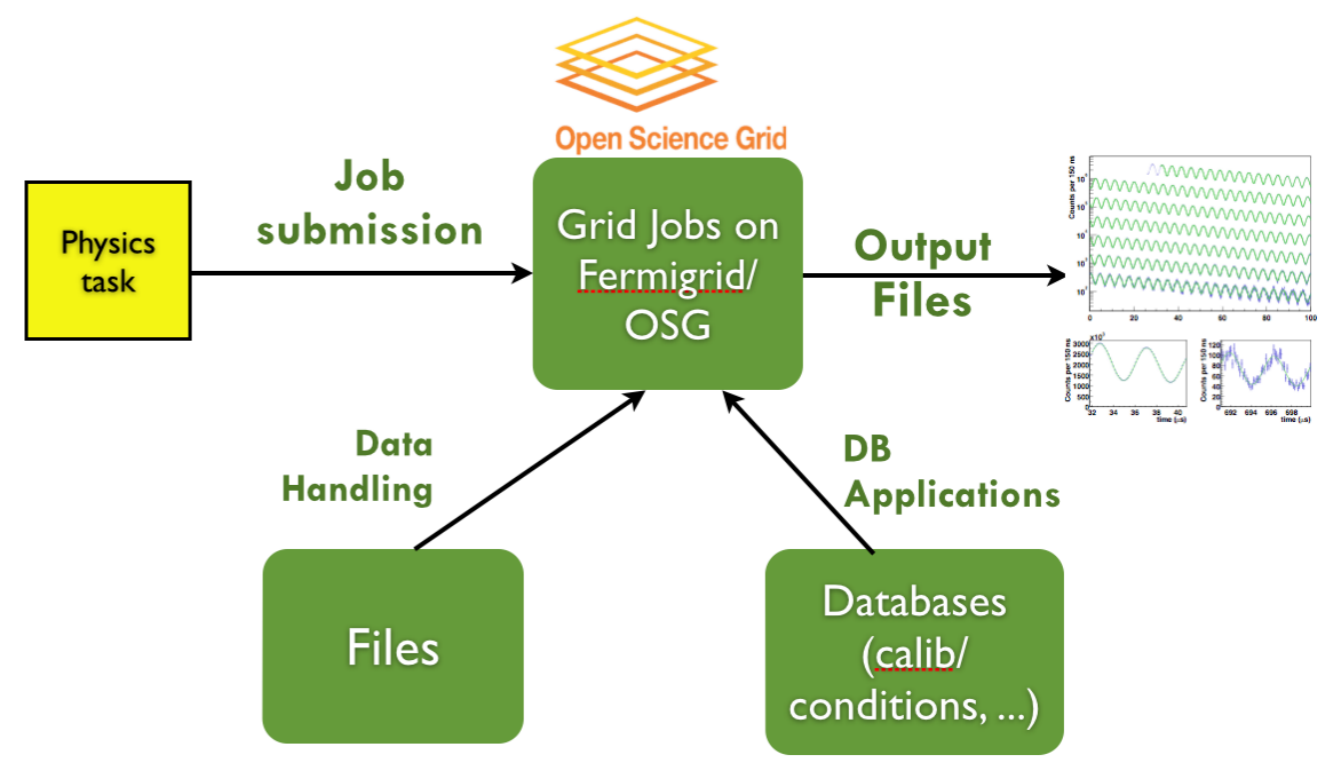

Some artdaq components are used by NOvA & uBooNE

Data are processed with the Fermilab Facility and Tools

Fabric for Frontier Experiments (FIFE)

A comprehensive set of services and tools for MC generation, reconstruction, and analysis processing on Fermilab and offsite OSG opportunistic resources [used by all neutrino/muon experiments at FNAL]

A new SCD Production Team was established to run production jobs for experiments [will be very beneficial for Mu2e and $g-2$]

See Gutsche talk in Breakout 5C

Both Muon $g-2$ and Mu2e benefit from computing expertise and leadership

Already mentioned Frameworks,
DAQ, Processing

Both experiments leverage FNAL's
expertise with Geant4

Interaction model

Geometry building

See Perdue talk in Breakout 5C

Behind the scenes support from SCD & CCD:

Redmine and code repositories,

Networking in MC-1 (SCD/CCD/AD),

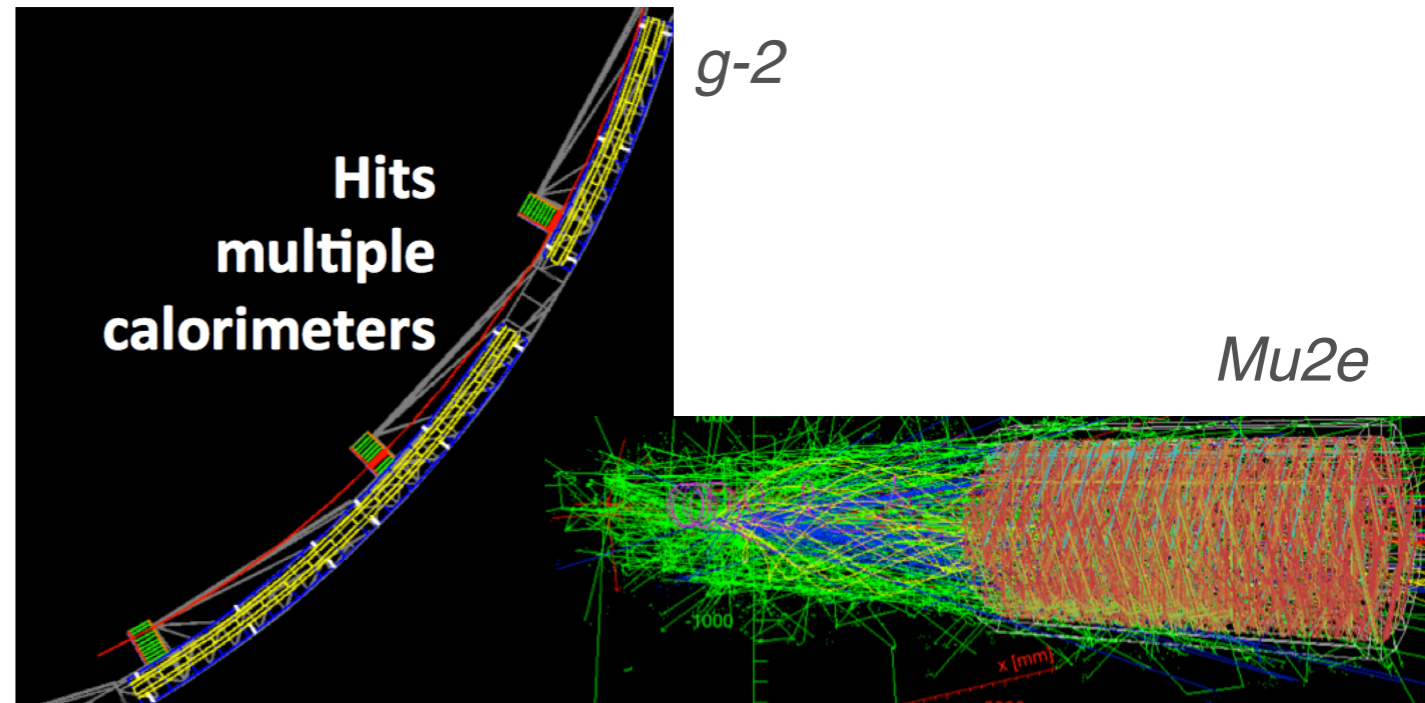

Desktop/Laptop support,

Databases,

IT management,

web pages,

E-mail, ...

In the past, some user interactions with
computing were bumpy; e.g. requesting new
accounts...

... now much smoother and streamlined - lots of
behind the scenes tracking of requests

Synergies with Theory are crucial

Fermilab theorists engaged with muon program in numerous ways including:

- Organized academic lecture series “The Allure of UltraSensitive Experiments.” including 4 talks on $g-2$, 4 on LFV, ...
- Hosted & organized 2014 “Lattice Meets Experiment” workshop addressing role of lattice-QCD calculations for $g-2$, $\text{Mu}2e$, ...

$g-2$ theory uncertainties need to improve!

Fermilab lattice theorists undertaking calculations of hadronic contributions

- Implementing recent improvements for vacuum polarization
- Developing & testing methods for light-by-light
- **RA Zhou** leading effort on dynamical QCD +QED gauge-field ensembles needed for HLbL
- Scientists **Kronfeld, Mackenzie, and Van de Water** pursuing these topics

See Campbell Plenary and Parke talk in Breakout 4C

Fermilab BSM theorists studying new-physics reach of $\text{Mu}2e$:

- 4 orders of magnitude better on muon-e-Higgs flavor violation than the LHC!
- Probes sleptons at 100 TeV scale

[Altmannshofer, Harnik, Zupan, JHEP 1311 (2013) 202]

Muon program personnel engage the future of the field (Snowmass 2013)

IF/Charged lepton group co-led by Brendan Casey, David Hitlin, Yuval Grossman

Significant engagement from FNAL scientists, including convening working groups and break-out sessions and writing and editing significant portions of the final report.

	Ongoing / planned	Future	Study group
$\mu \rightarrow e\gamma$	MEG upgrade plans to get to 5×10^{-14} based on $10^8 \mu/s$ DC	What can be done with $10^9-10^{10} \mu/s$?	Yury Kolomensky, <u>Doug Glenzinski</u> , David Hitlin, Yuval Grossman, Chih-hsiang Cheng, Bertrand Echenard, Jim Miller, Craig Group, <u>Kyle Knoepfel</u>
$\mu \rightarrow eee$	$\mu 3e$ plans on 10^{-15} based on $10^8 \mu/s$ DC and 10-16 based on $10^9 \mu/s$ DC from spallation target	What can be done with $10^{10} \mu/s$? Can something be done with mu2e solenoid? What do we get from a Dalitz plot analysis?	
$\mu N \rightarrow e N$	COMET and Mu2e plan on 6×10^{-17} based on $10^{11} \mu/s$ pulsed	What can be done with $10^{13} \mu/s$ pulsed? Can we do different nuclei?	
$\mu - N \rightarrow \mu + N'$		How far can we get with the mu2e solenoid?	
$\mu - N \rightarrow e + N'$		How far can we get with the mu2e solenoid?	
μ EDM	g-2 expects 10^{-21}	What can we do with continued running? Can we get to m^2 scaling with the electron with a dedicated experiment?	<u>Mandy Rominsky</u> , Leah Welty-Reiger
g-2	FNAL and J-PARC plan on 140 ppb for $\mu+$	Can $\mu-$ be done to this level? How will the SM value evolve? Can systematics be reduced with a significant increase in beam power?	<u>Thomas Gadfort</u>
Muonium mixing		Is there motivation for factor 100 improvement? What would the experiment look like?	
Muon decay parameters		Can we get significant improvement beyond TWIST?	<u>Andrei Gaponenko</u>
Surface muons	PSI has $10^8 \mu/s$	What are the possibilities with a next generation source?	<u>Brendan Keiberg</u> , Peter Winter
τ LFV EDM, τ g-2	New limits based on several ab-1 from super B factories and several fb-1 from LHCb	Comparison of sensitivity with longitudinally polarized and unpolarized electron beams at luminosities of 10^{36} and beyond	
Tau decay parameters		How well can these be done at a Super B factory?	

Fermilab Contribution

Muon program personnel in the community

We participate in reviews, organize conferences, members on HEPAP and DPF Executive Committee, and members are APS Fellows, Snowmass Leadership

We give colloquia, seminars, public talks, and tours

Brendan Kiburg, Lederman Fellow

TED^x Naperville
 x = independently
 organized TED event

Science display at Indian Prairie Public Library
 in honor of Adam Lyon's talk

Doug Glenzinski, Fermilab Physics Slam

Strategic plans

Muon $g-2$ and Mu2e drive the immediate future

$g-2$ sees first muons in early 2017

Mu2e starts commissioning in 2020

Leveraging these experiments:

Mu2e II (PIP-II; Ti target)

μ^- running for $g-2$

New concepts:

Dedicated storage ring for proton EDM

$\mu \rightarrow eee$

$\mu \rightarrow e\gamma$

Summary

The Muon program...

brings together all parts of the lab

and collaborators from institutions world-wide

to make a program more than the sum of its parts

to do precision physics that may lead

to vital discoveries beyond the Standard Model

See breakout talks for many more details!

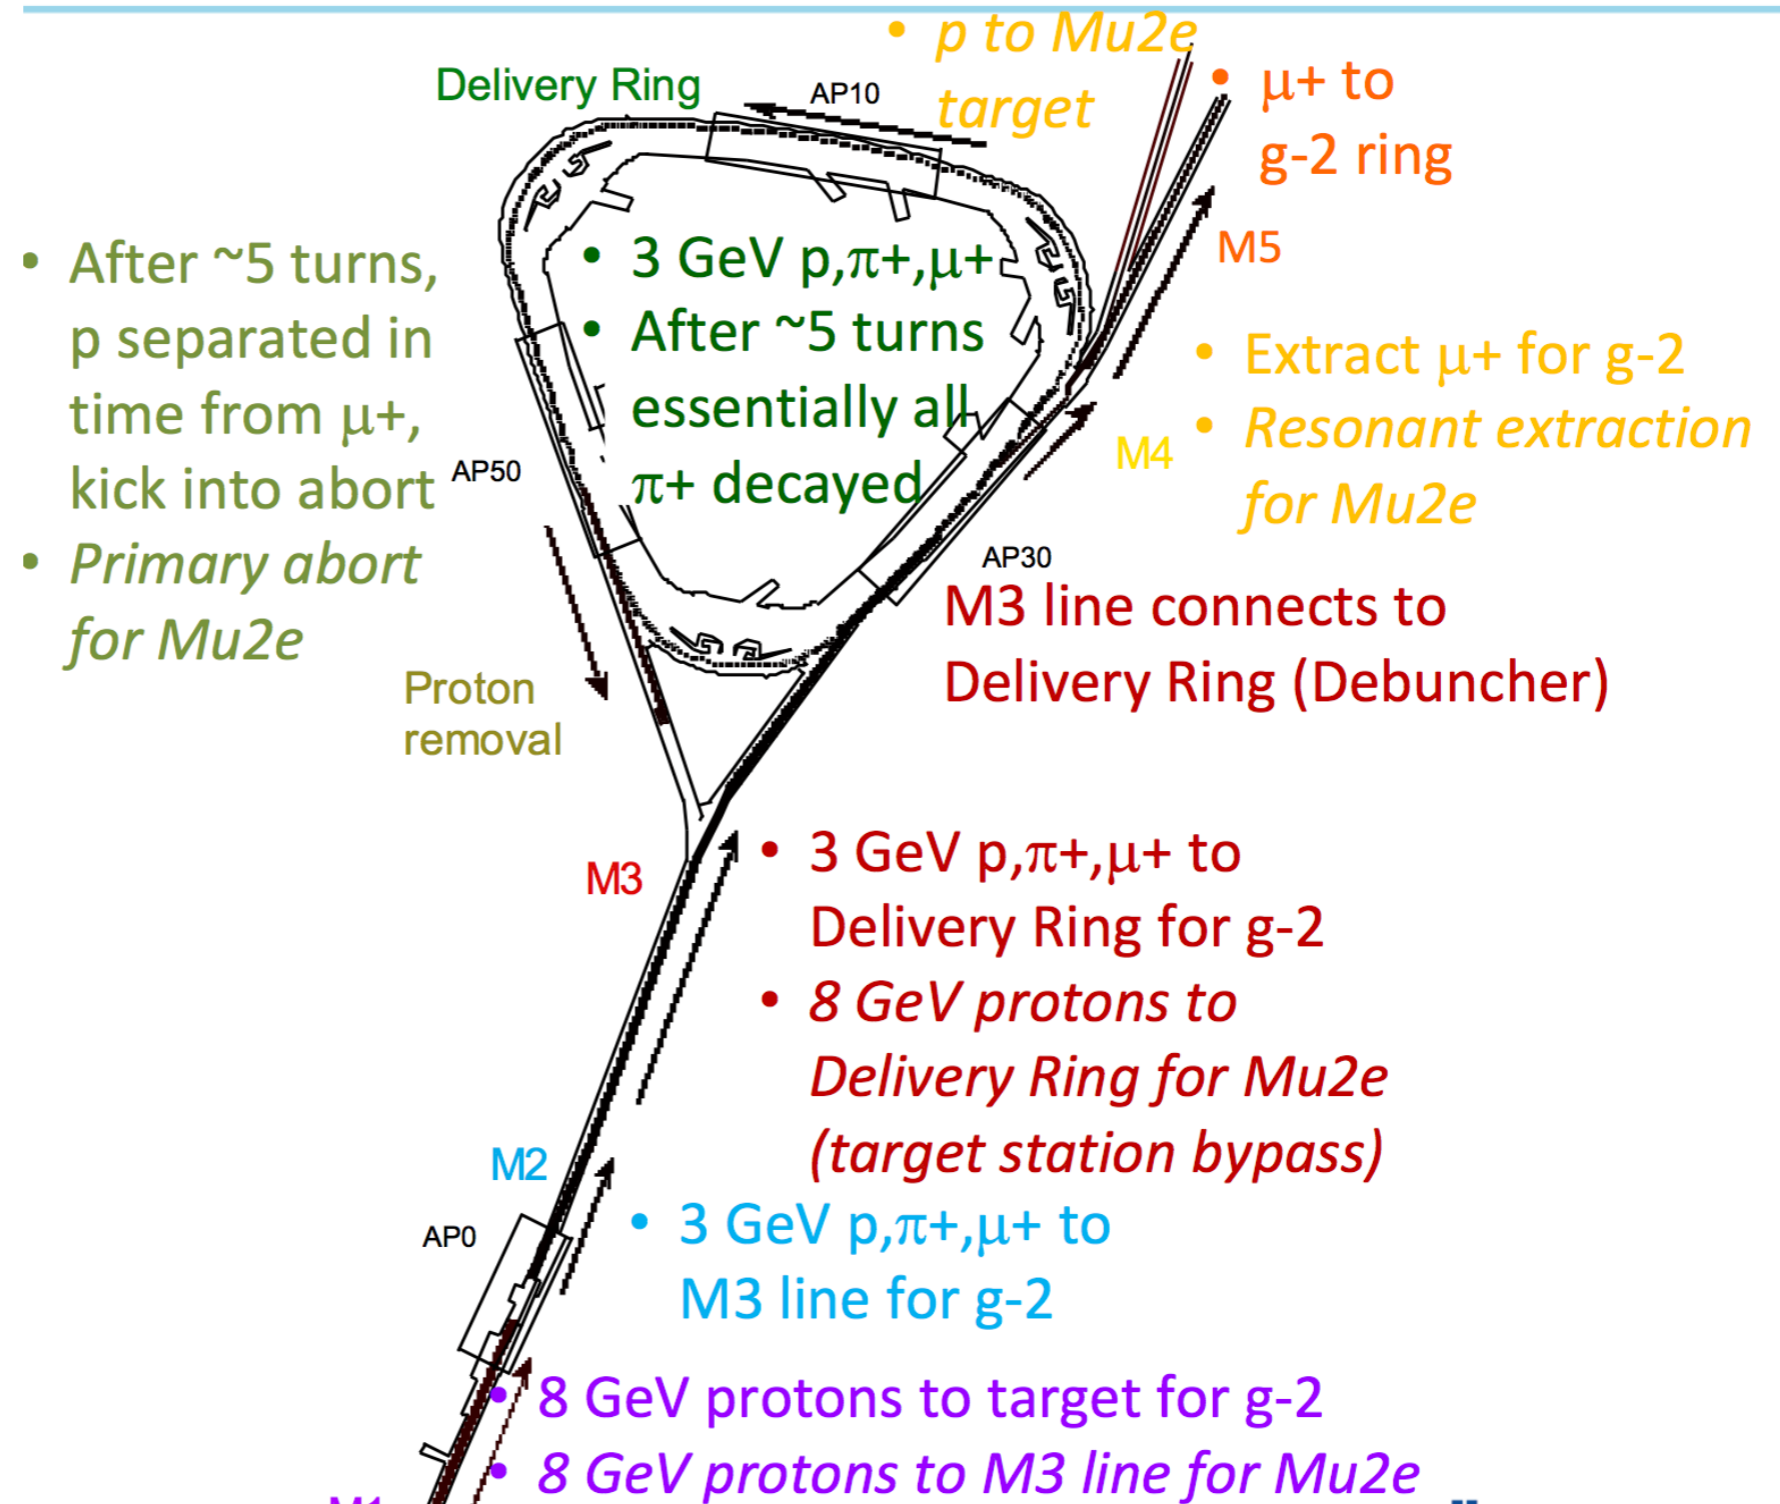

Muon $g-2$ in a nutshell

LIFE OF A MUON: THE $g-2$ EXPERIMENT

Muon Campus

The Muon Campus supports both experiments

1D

Reuse existing infrastructure of the “pbar” source to deliver muons (target, lens, magnets, ...)

Funded by Accelerator Improvement Projects (AIP)

- Recycler RF: For rebunching
- Beam transport: To deliver beam to campus
- Delivery Ring: To converting debuncher ring
- Cryogenics: For Mu2e solenoids and $g-2$ ring

and General Plant Projects (GPP)

- MC-1 Building: Houses $g-2$, cryo refrigerators, beam line power supplies
- Beam line enclosure: New tunnels
- Muon Campus Infrastructure: e.g. cooling for cryo compressors, extension of MI-52 building

Managed by Muon Campus Program Coordinator (Mary Convery)

Expertise collected in one AD Department (Muon Dept)

Common solutions and shared infrastructure for $g-2$ and $Mu2e$ have saved ~\$100M compared to each experiment making its own solution

We do great science by exploring the unknown

While the Standard Model is incredibly successful,

it gives an **incomplete** picture of nature:

Gravity? Matter/antimatter asymmetry? Dark Matter? SUSY?

Search for new phenomena **beyond** the SM...

No SUSY, Leptoquarks, Dark Matter, ... has been seen directly

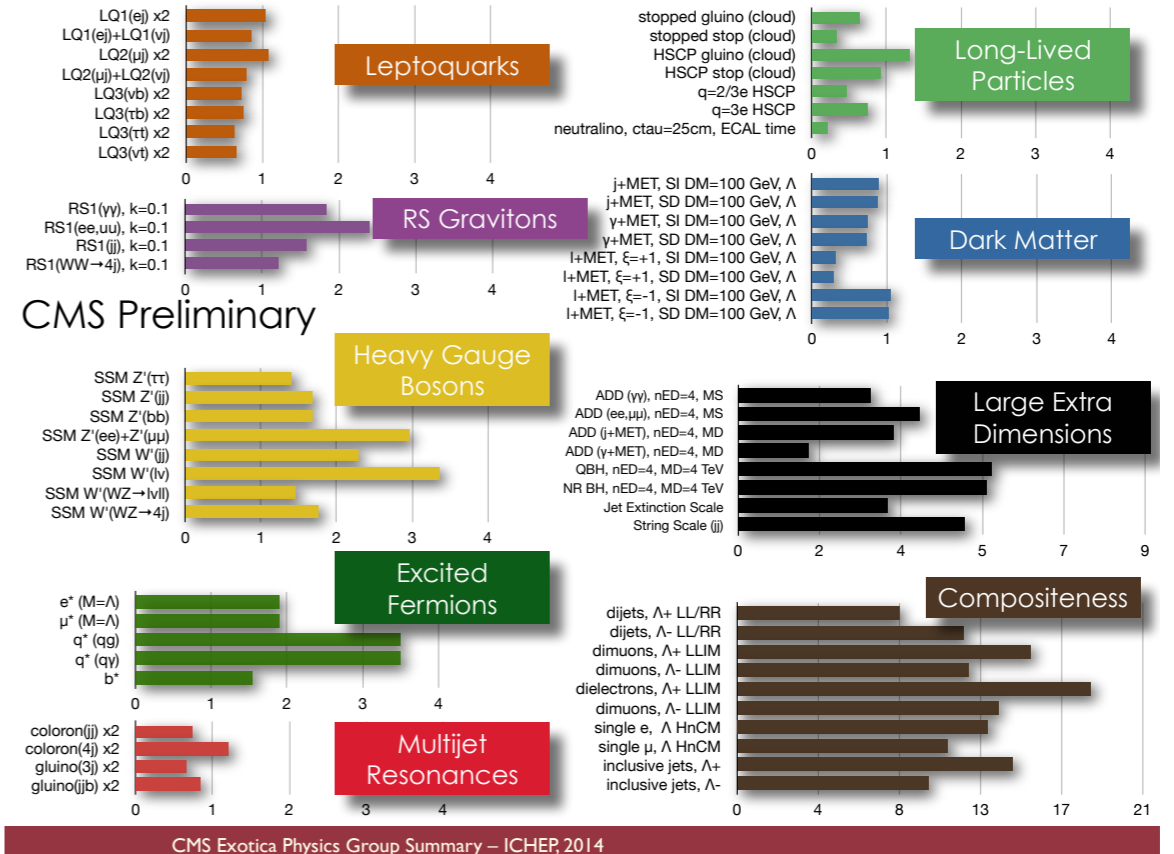

ATLAS SUSY Searches* - 95% CL Lower Limits

$\tilde{t}_2\tilde{t}_2, \tilde{t}_2 \rightarrow t\tilde{b} + Z$	3 e, μ (Z)	1 b	Yes	20.3	\tilde{t}_2 290-600 GeV	1403.5222
EW direct						
$\tilde{t}_1\tilde{t}_1, \tilde{t}_1 \rightarrow b\tilde{t}$	2 e, μ	0	Yes	20.3	\tilde{t}_1 90-325 GeV	1403.5294
$\tilde{t}_1\tilde{t}_1, \tilde{t}_1 \rightarrow W\tilde{b}$	2 e, μ	0	Yes	20.3	\tilde{t}_1 140-465 GeV	1403.5294
$\tilde{t}_1\tilde{t}_1, \tilde{t}_1 \rightarrow t\tilde{b}$	2 τ	0	Yes	20.3	\tilde{t}_1 100-350 GeV	1407.0350
$\tilde{t}_1\tilde{t}_1, \tilde{t}_1 \rightarrow t\tilde{b}$	3 e, μ	0	Yes	20.3	\tilde{t}_1 420 GeV	1402.7029
$\tilde{t}_1\tilde{t}_1, \tilde{t}_1 \rightarrow t\tilde{b}$	2-3 e, μ	0	Yes	20.3	\tilde{t}_1 700 GeV	1403.5294, 1402.7029
$\tilde{t}_1\tilde{t}_1, \tilde{t}_1 \rightarrow t\tilde{b}$	1 e, μ	2 b	Yes	20.3	\tilde{t}_1 285 GeV	ATLAS-CONF-2013-093
$\tilde{t}_1\tilde{t}_1, \tilde{t}_1 \rightarrow t\tilde{b}$	4 e, μ	0	Yes	20.3	\tilde{t}_1 620 GeV	1405.5086
Long-lived particles						
Direct $\tilde{t}_1\tilde{t}_1$ prod., long-lived \tilde{t}_1	Disapp. trk	1 jet	Yes	20.3	\tilde{t}_1 270 GeV	ATLAS-CONF-2013-089
Stable, stopped \tilde{g} R-hadron	0	1-5 jets	Yes	27.9	\tilde{g} 832 GeV	1310.6584
GMSB, stable \tilde{t}_1 , $\tilde{t}_1 \rightarrow t\tilde{b}$	1-2 μ	-	-	15.9	\tilde{t}_1 475 GeV	ATLAS-CONF-2013-058
GMSB, $\tilde{t}_1 \rightarrow \gamma\tilde{g}$, long-lived \tilde{t}_1	2 γ	-	Yes	4.7	\tilde{t}_1 230 GeV	1304.6310
$\tilde{q}\tilde{q}, \tilde{t}_1 \rightarrow q\tilde{q}$ (RPV)	1 μ , displ. vtx	-	-	20.3	\tilde{q} 1.0 TeV	ATLAS-CONF-2013-092
RPV						
LFV $pp \rightarrow \tilde{\nu}_e + X, \tilde{\nu}_e \rightarrow e + \mu$	2 e, μ	-	-	4.6	$\tilde{\nu}_e$ 1.61 TeV	1212.1272
LFV $pp \rightarrow \tilde{\nu}_e + X, \tilde{\nu}_e \rightarrow e(\mu) + \tau$	1 $e, \mu + \tau$	-	-	4.6	$\tilde{\nu}_e$ 1.1 TeV	1212.1272
Bilinear RPV CMSSM	2 e, μ (SS)	0-3 b	Yes	20.3	\tilde{g}, \tilde{z} 1.35 TeV	1404.2500
$\tilde{t}_1\tilde{t}_1, \tilde{t}_1 \rightarrow W\tilde{b}$	4 e, μ	-	Yes	20.3	\tilde{t}_1 750 GeV	1405.5086
$\tilde{t}_1\tilde{t}_1, \tilde{t}_1 \rightarrow t\tilde{b}$	3 $e, \mu + \tau$	-	Yes	20.3	\tilde{t}_1 450 GeV	1405.5086
$\tilde{g} \rightarrow q\tilde{q}$	0	6-7 jets	-	20.3	\tilde{g} 916 GeV	ATLAS-CONF-2013-091
$\tilde{g} \rightarrow q\tilde{q}$	2 e, μ (SS)	0-3 b	Yes	20.3	\tilde{g} 850 GeV	1404.2500
Other						
Scalar gluon pair, sgluon $\rightarrow q\tilde{q}$	0	4 jets	-	4.6	sgluon 100-287 GeV	1210.4826
Scalar gluon pair, sgluon $\rightarrow t\tilde{t}$	2 e, μ (SS)	2 b	Yes	14.3	sgluon 350-800 GeV	ATLAS-CONF-2013-051
WIMP interaction (DS, Dirac χ)	0	mono-jet	Yes	10.5	\tilde{M}^{scale} 704 GeV	ATLAS-CONF-2012-147

ATLAS Preliminary

$\sqrt{s} = 7, 8 \text{ TeV}$

Not for lack of trying!

What will LHC Run II bring?
