## Type of generation

## Loop Induced

## Why?

- Main production mechanism for Higgs \& Higgs associated processes
- Contribution for NNLO computation
- Correction to shape of observables
- We have the tool available

## Loop Induced

## Why?

- Main production mechanism for Higgs \& Higgs associated processes
- Contribution for NNLO computation
- Correction to shape of observables
- We have the tool available

## Difficulties?

- The phase-space integration is based on the born diagram
- Loop evaluation are extremely slow
- Need Leading Color information for writing Events associated to the loop

## Loop Induced

## Difficulties?

- The phase-space integration is based on the born diagram
- Loop evaluation are extremely slow
- Need Leading Color information for writing Events associated to the loop

OLD Solution

- Use Effective Field Theory (=> Tree)
- And correct the mass effect

$$
W_{\text {new }}=\frac{\left|M_{\text {new }}\right|^{2}}{\left|M_{\text {old }}\right|^{2}} * W_{\text {old }}
$$

- Difficult control on numerical uncertainty
- Wrong Leading Color information/helicity
- Not generic

## Loop Induced

## Difficulties?

- The phase-space integration is based on the born diagram
- Loop evaluation are extremely slow
- Need Leading Color information for writing Events associated to the loop

OLD Solution

- Use Effective Field Theory (=> Tree)
- And correct the mass effect

$$
W_{\text {new }}=\frac{\left|M_{\text {new }}\right|^{2}}{\left|M_{\text {old }}\right|^{2}}
$$

- Diffir on .certainty y Leading Color ormation/helicity
- Not generic

## Exact Integration

## Difficulties?

-The phase-space integration is based on the born diagram

- Loop evaluation are extremely slow
- Need Leading Color information for writing Events associated to the loop

New Solution

- Contract the loop to have tree-level diagrams which drive the integration multichannel
-Use Monte-Carlo over helicity
-Compute the loop with the color flow algebra
- more parallel code

## parallelization

MadEvent

$$
|M|^{2}=\frac{\left|M_{1}\right|^{2}}{\left|M_{1}\right|^{2}+\left|M_{2}\right|^{2}}|M|^{2}+\frac{\left|M_{2}\right|^{2}}{\left|M_{1}\right|^{2}+\left|M_{2}\right|^{2}}|M|^{2}
$$

## parallelization

MadEvent

$$
\int|M|^{2}=\int \frac{\left|M_{1}\right|^{2}}{\left|M_{1}\right|^{2}+\left|M_{2}\right|^{2}}|M|^{2}+\int \frac{\left|M_{2}\right|^{2}}{\left|M_{1}\right|^{2}+\left|M_{2}\right|^{2}}|M|^{2}
$$

MadEvent

$$
\int|M|^{2}=\iint \frac{\left|M_{1}\right|^{2}}{\left|M_{1}\right|^{2}+\left|M_{2}\right|^{2}}|M|+\left.\left|\int \frac{\left|M_{2}\right|^{2}}{\left|M_{1}\right|^{2}+\left|M_{2}\right|^{2}}\right| M\right|^{2}
$$

- Iteration 2
- Grid Refinement
- Grid Refinement

## First Example: g g> h

User Input

- generate g g > h [QCD]
- output
- launch

Loop Induced

$$
\sigma_{\text {loop }}=15.74(2) p b
$$

HEFT

$$
\sigma_{\text {heft }}=17.63(2) p b
$$

## First Example: g g> h

User Input

- generate g g > h [QCD]
-output
- launch

Loop Induced

$$
\sigma_{\text {loop }}=15.74(2) p b
$$

HEFT
No bottom loop
$\sigma_{\text {heft }}=17.63(2) p b$

$$
\sigma_{\text {toploop }}=17.65(2) p b
$$

Validation p p > h j
Durham

Validation p p > h j
Durham

## Validation pp>hj

- b effect only important at low pt
- at large pt, this is just a re-scaling

## KT MLM

Differential Jet Rate $1 \rightarrow 0$

Differential Jet Rate $2 \rightarrow 1$

$Q_{\text {match }}=50 \mathrm{GeV}$

BSM technicalities

- Our code is fully ready for (all) BSM
- We (only) need NLO-UFO model
- Except if you provide the loop matrix-element.

# BSM Example: 2HDM 

BSM technicalities

- Our code is fully ready for (all) BSM
- We (only) need NLO-UFO model
- Except if you provide the loop matrix-element.

- MadGraph5_aMC@NLO
- Framework for LO and NLO computation
- Fixed order or matched to the shower
- Merging possible
- SM and BSM on the same level
- Loop-Induced
- Code in public beta
- Fine tuning in progress
- Officially release in ~ weeks
