# NEW PHYSICS (NP) IN TOP

(Top quark subgroup of High-Energy Frontier)

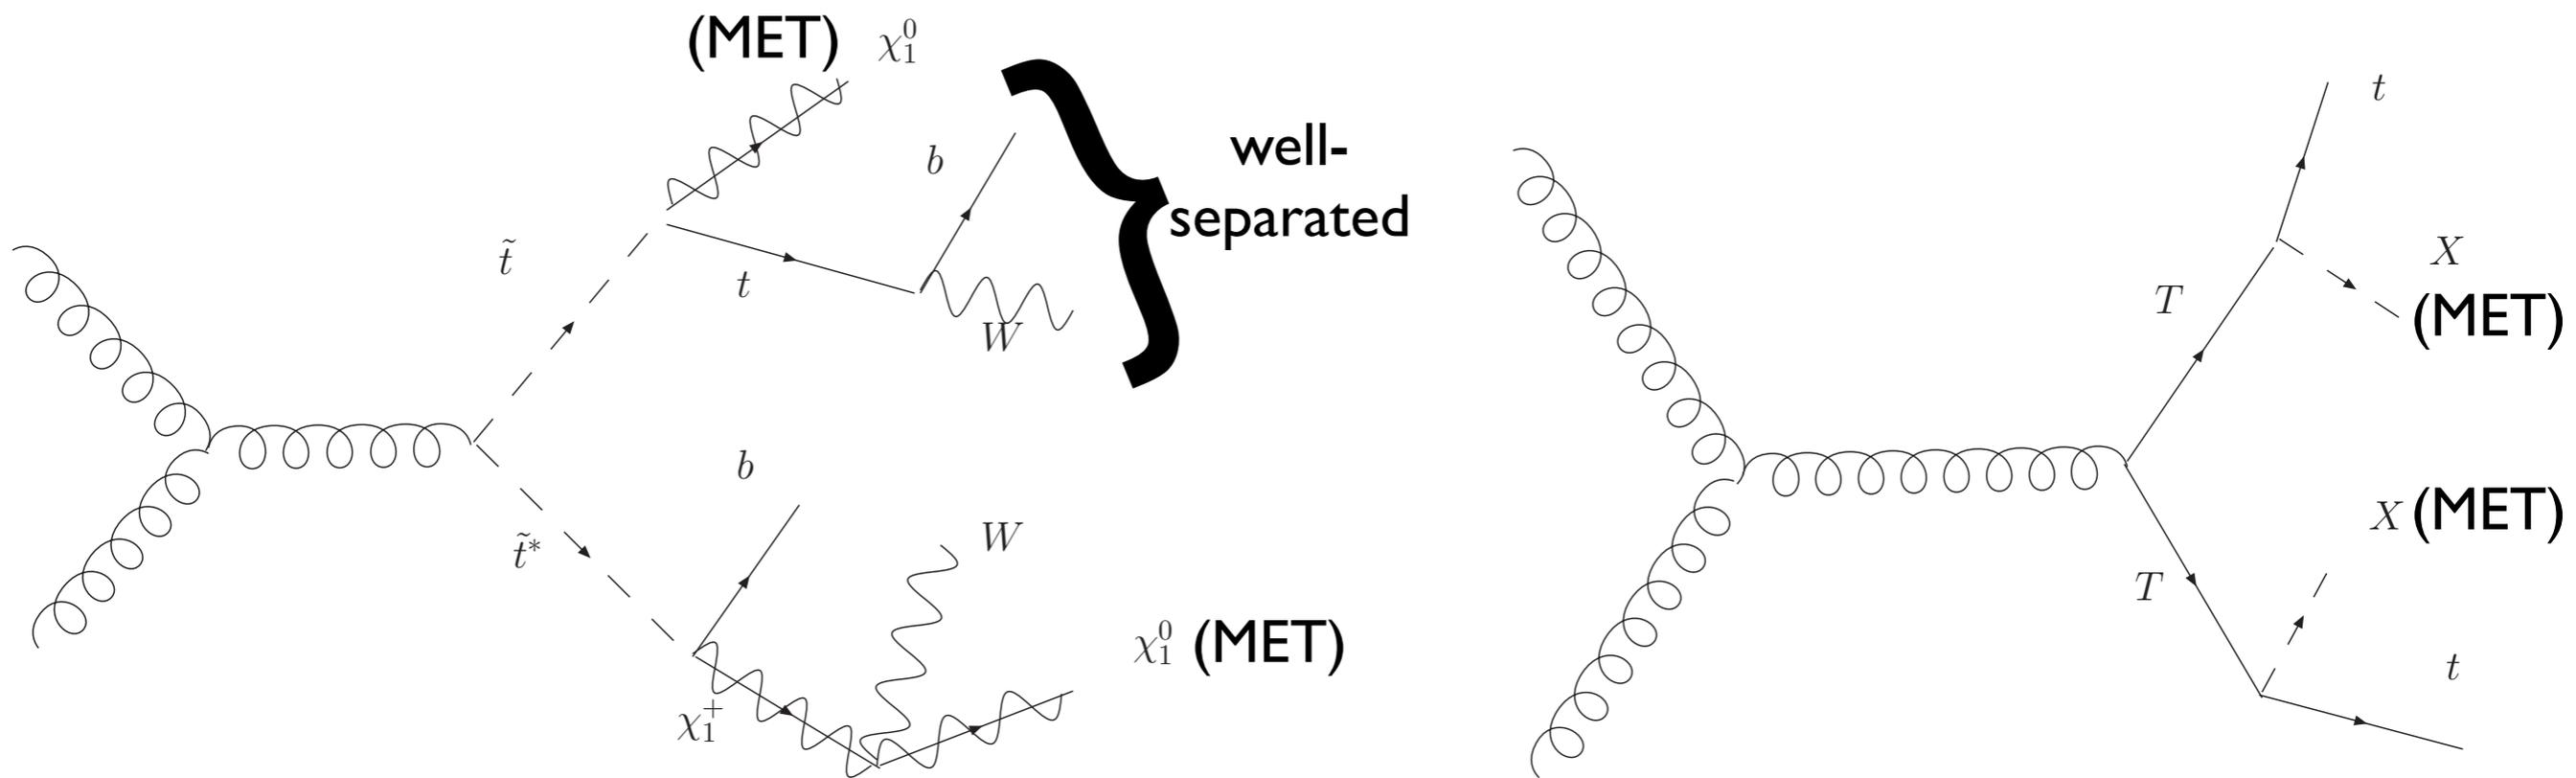

Why NP in top quark?

# LIGHT (BELOW 1 TEV) NP: TOP PARTNER

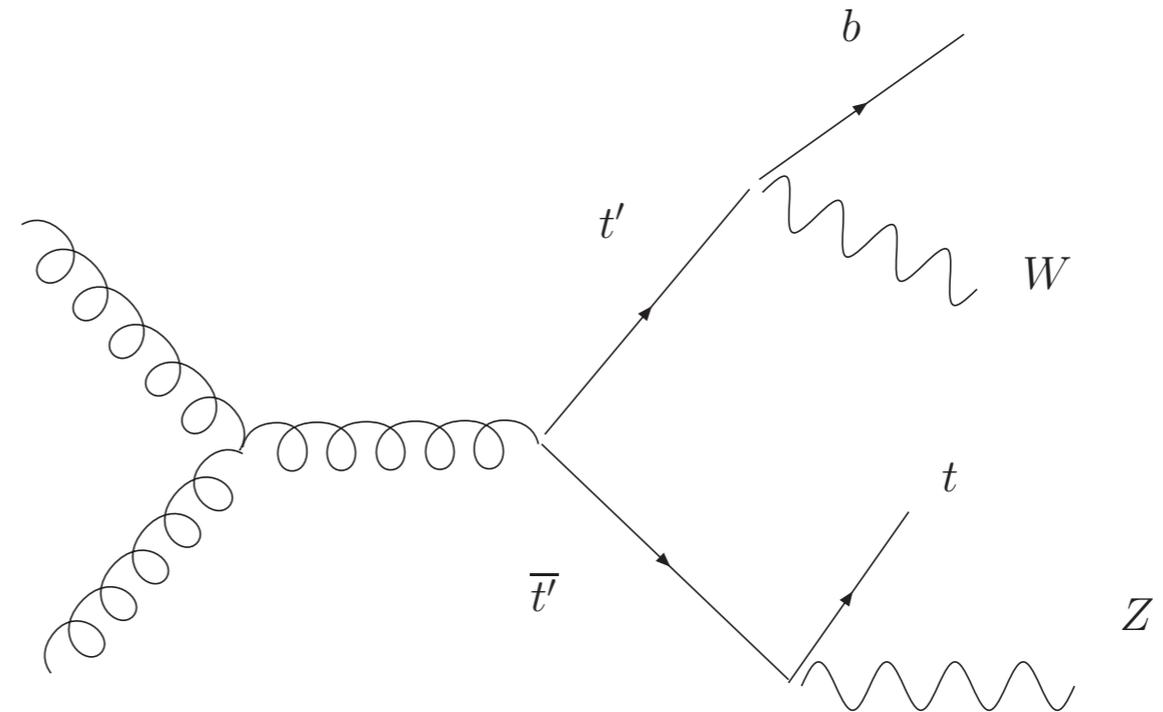

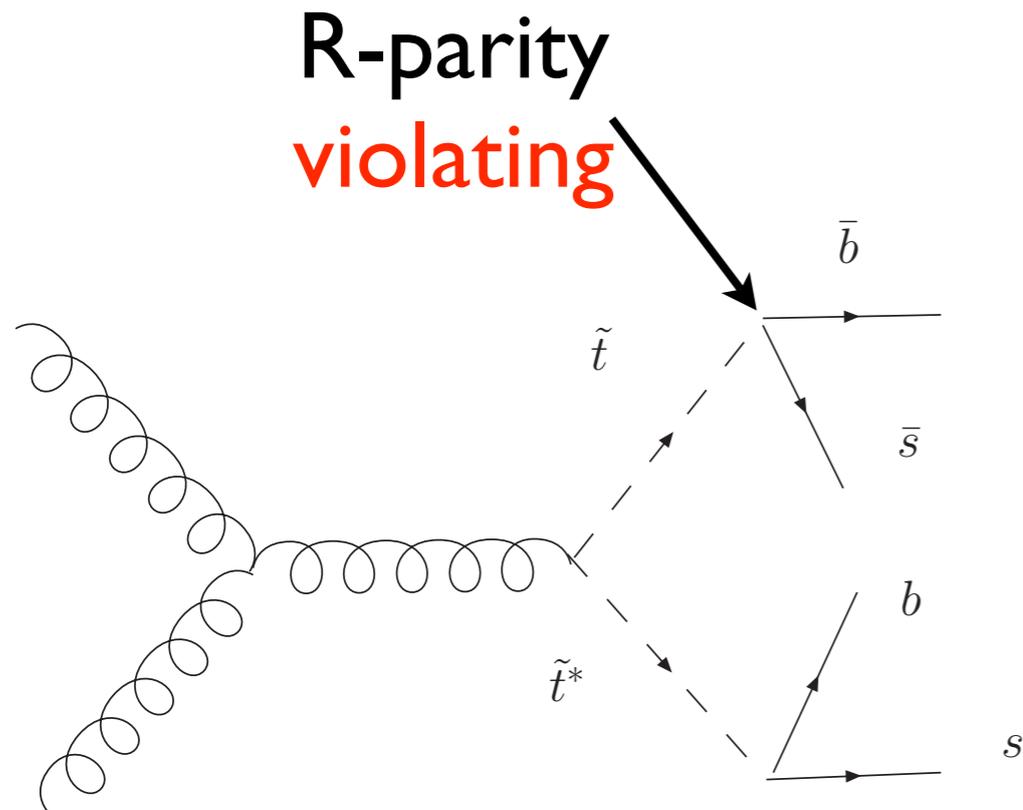

cancels divergence  
in Higgs mass from  
top loop

# Top partner $\rightarrow$ “top-like” + MET

- How well can we get rid of top background (MET from SM)?
- How well can we distinguish “**scalar** top partner” (aka. “stop”) from **fermionic** (little-Higgs with T-parity) at LHC?
- Is **ILC** needed for the above purpose (e.g., for heavier top partner)?
- What if MET is **small** (“compressed” spectrum: top partner is degenerate with top + invisible)?

# Top partner → “top-like”, but **no** MET

- Can natural **stop** hide ?

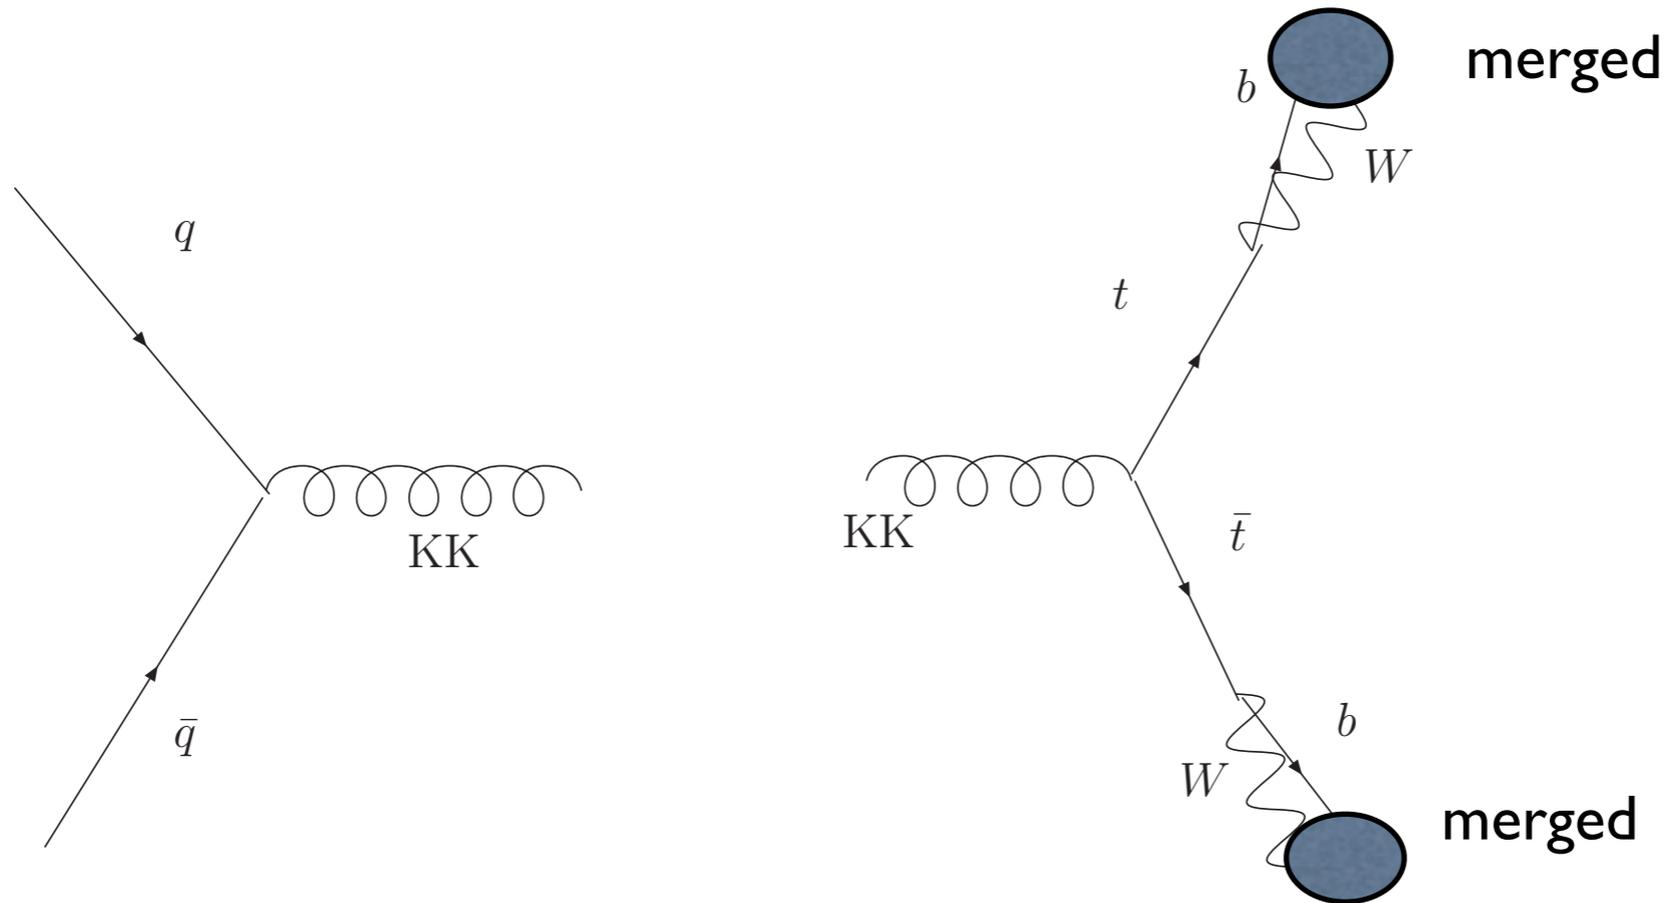

- natural **fermionic** top partner (e.g., composite Higgs) allowed by LHC?

(aka **4th** generation/**exotic** quark)

INTERMEDIATE (1-5  
TeV) NP:

RESONANCE IN TOP PAIR

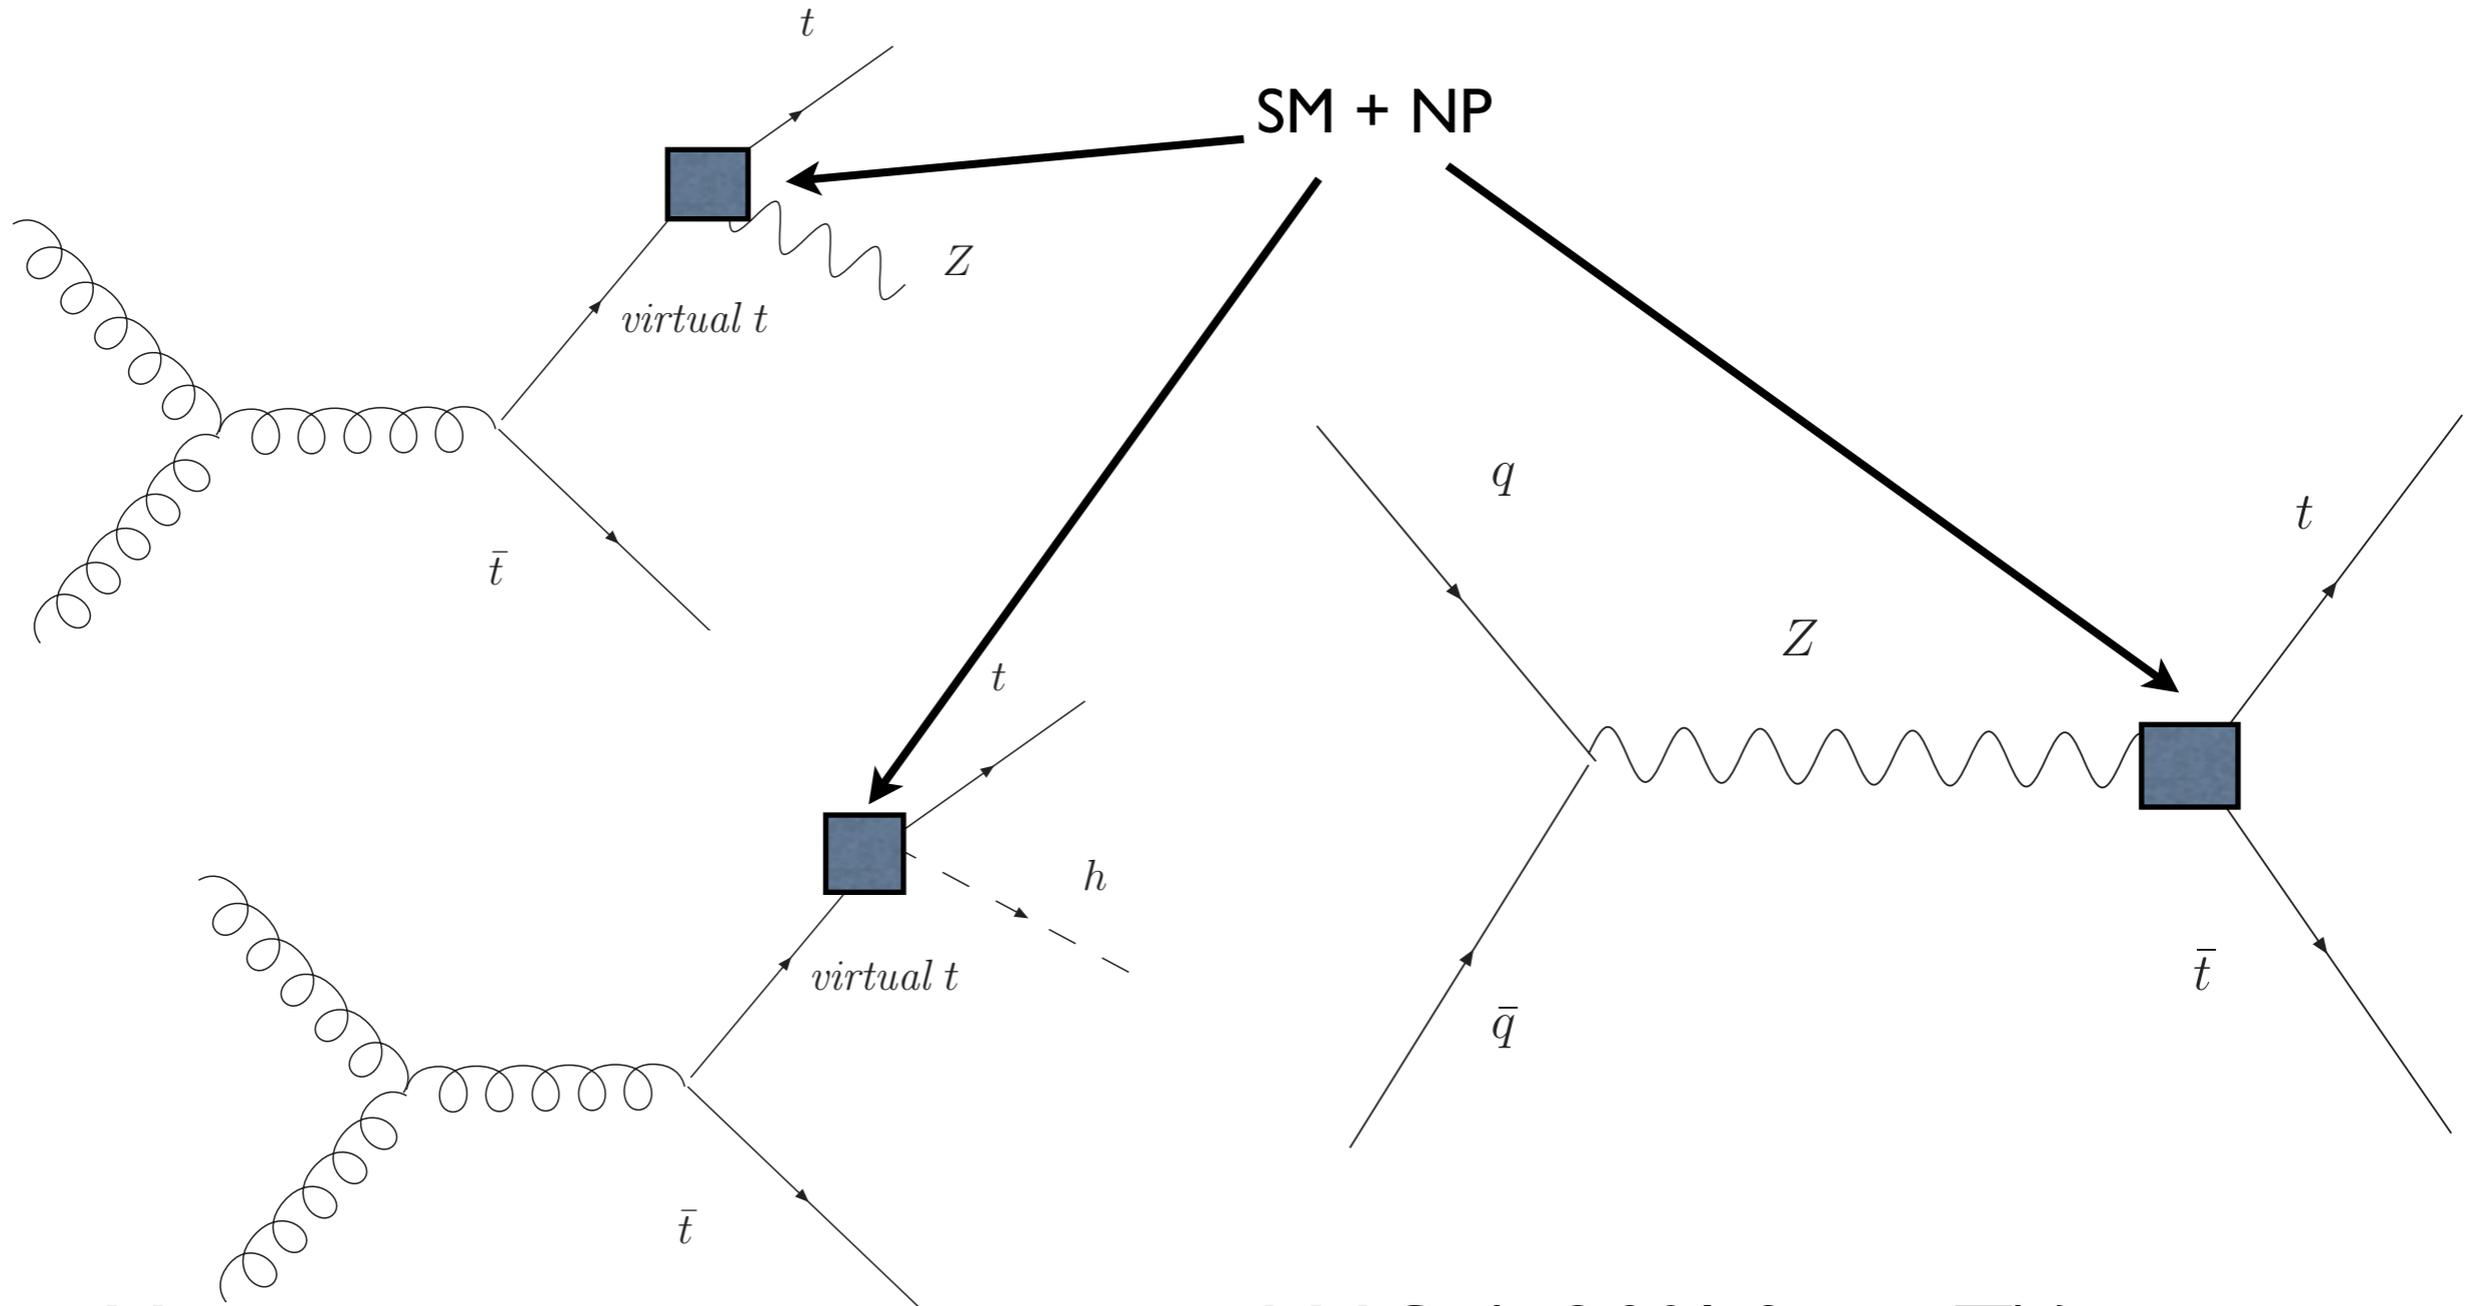

# Boosted top pair

- How “robust” are the techniques?
- What is the ultimate LHC reach?

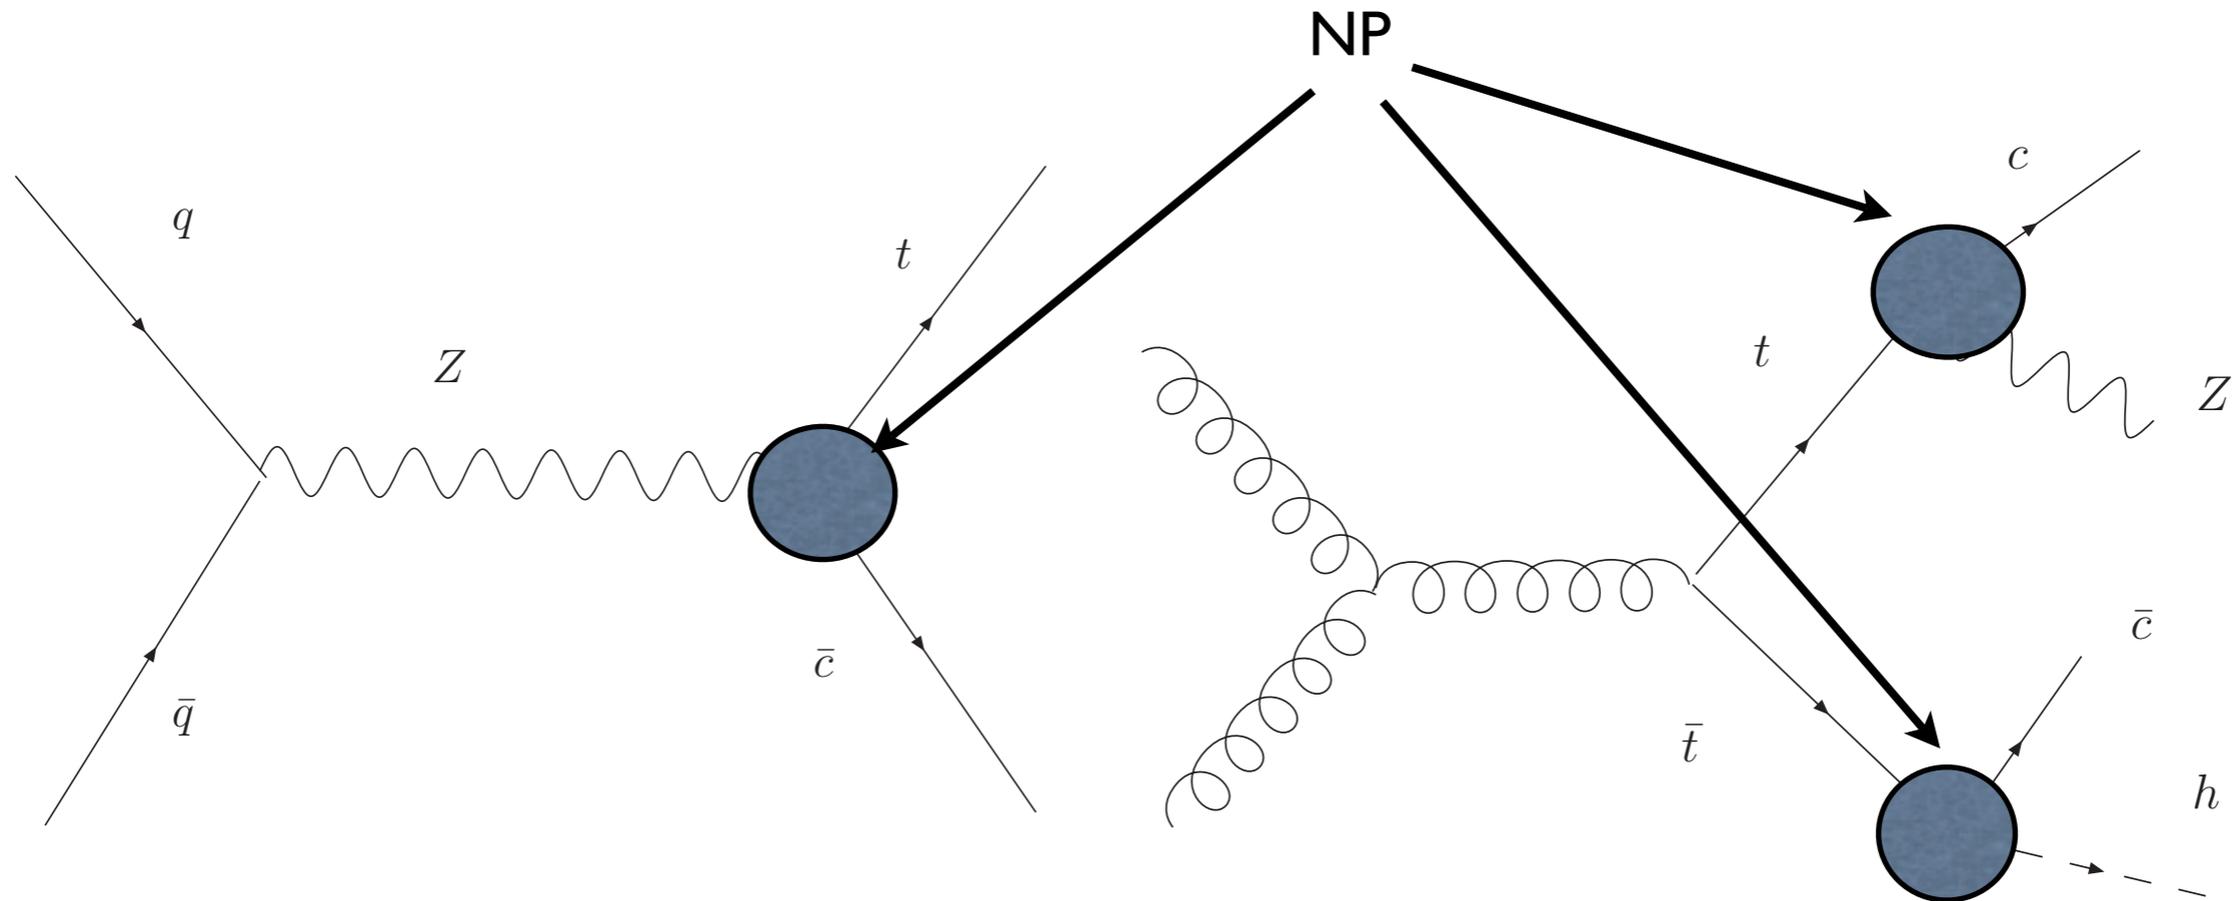

HEAVY (ABOVE 5 TEV) NP:  
INDIRECT EFFECTS ON TOP  
PROPERTIES

# Shift in **existing** top couplings

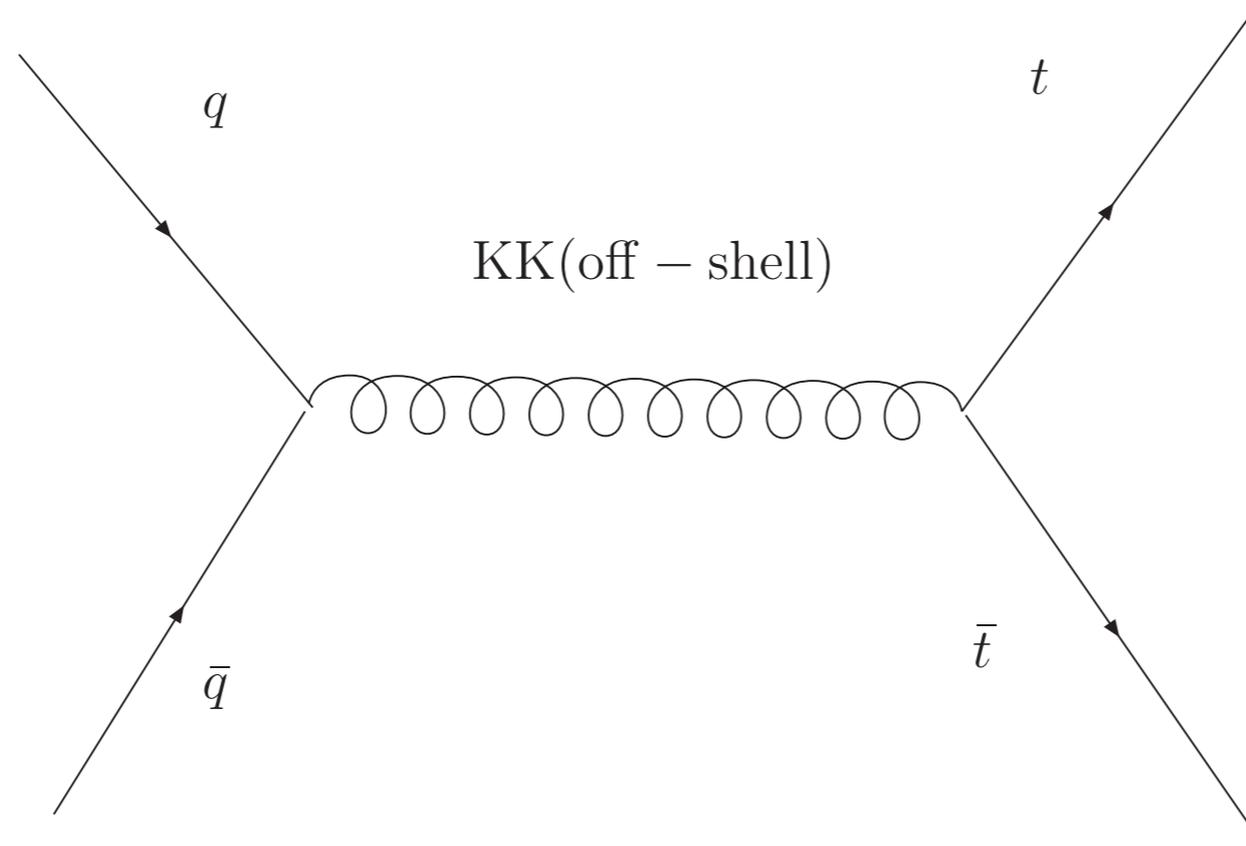

- How well can we measure at LHC ( $\sim 20\%$  for  $ttZ$ )?
- Is ILC needed for precision relevant for NP models ( $\sim 10\%$  for  $ttZ$ )?
- also  $tbW$ ...

# Rare top decays (SM negligible)

- How well can LHC measure?
- Is ILC needed for sensitivity relevant for NP models?
- also  $t \rightarrow b H^+ \dots$

# (Other) effects on top pair production

- **Anomaly** in top forward backward asymmetry (at Tevatron...and LHC eventually?) vs. **not** in charge asymmetry (currently at LHC)
- Excluded by other data (e.g., di-jet, same-sign top)?
- How well do we know SM prediction?

JOIN THE FUN!

BACK-UP

# Overlaps with...

- SM top physics/QCD (“background”)
- detector issues with top (e.g. boosted)
- New particles subgroup
- Electroweak (e.g., precision fit)
- Higgs subgroup (e.g., coupling to top: flavor-preserving/violating)

# Why top?

- NP at TeV scale to address Planck-weak hierarchy
- ...must couple to Higgs
- Top quark couples strongly to Higgs
- NP couples to top quark
